1.0 INTRODUCTION

Rexford Industrial Realty, L.P. (Applicant) is seeking approval of a Major Site Plan Review (No. 1072-21) and Design Review (No. 5059-21) from the City of Orange to demolish the existing 30,923 square feet (SF) of existing buildings that include an event center, two residential units, and industrial structures and to develop two new industrial warehouse buildings totaling approximately 97,170 SF (proposed Project). The City of Orange is the Lead Agency for the proposed Project. The Lead Agency will utilize this document as evidence that the proposed Project qualifies for the Class 32 Infill Exemption, which is further described below.

1.1 PURPOSE OF NOTICE OF EXEMPTION

Article 19 of the California Environmental Quality Act (CEQA) Guidelines includes, as required by Public Resources Code Section 21084, a list of classes of projects which have been determined not to have a significant effect on the environment. This document demonstrates that the proposed Project qualifies for a CEQA Exemption as an Infill Development Project (Class 32 Exemption), consistent with the provisions of CEQA Guidelines Sections 15332 and 15300.2 and provides information for City decision-makers to find that the proposed project is exempt under CEQA.

Pursuant to CEQA Guidelines Section 15332, the Project qualifies for a Class 32 Exemption because it is: (1) consistent with the General Plan designation and policies and Zoning regulations; (2) is located within the City limits, surrounded by urban uses and is no more than 5 acres in size; (3) has no value for endangered, rare or threatened species; (4) would not result in any significant effects related to traffic, noise, air quality or water quality; and (5) can be adequately served by all required utilities and public services. Additionally, this document demonstrates that the Project and its circumstances would not result in any exceptions identified in CEQA Guidelines Section 15300.2.

1.2 DOCUMENT ORGANIZATION

This Exemption Checklist includes the following sections:

Section 1. Introduction

Provides information about CEQA, its requirements for environmental review, and explains the Exemption Checklist that evaluates the potential impacts of the proposed Project to the physical environment.

Section 2. Project Setting

Provides information about the proposed Project's location, the Project site, and background.

Section 3. Project Description

Includes a description of the proposed Project's physical features and construction and operational characteristics.

Section 4. Discretionary Approvals

Describes anticipated approvals and permits needed for implementation of the proposed Project.

Section 5. Class 32 Infill Exemption Requirements

Includes the Exemption Checklist and evaluates the proposed Project's potential to result in significant adverse effects to the physical environment.

2 PROJECT SETTING

2.1 PROJECT LOCATION

The Project site is located at 2390 North American Way in the northwestern portion of the City of Orange, within the County of Orange. The site consists of three parcels (APN 374-632-08, 374-632-07, and 374-632-05) located on 4.01 gross acres directly west of North American Way. Regional access to the Project site is provided by State Route 57 (SR-57) located approximately 1 mile west, State Route (SR-91) 1.2 miles north, and State Route 55 (SR-55) located 1.4 miles east. Local Access to the site is via 3 collector streets; West Fletch Avenue, North Industrial Way, and West Freedom Avenue. The existing site and surrounding area are shown in Figure 1, *Regional Location*. Local access is available from Slover Avenue as shown in Figure 2, *Local Vicinity*.

2.2 EXISTING PROJECT SITE

The Project site encompasses 3 parcels totaling approximately 4.01 gross acres. The site is relatively flat and the entire site has been disturbed with development and industrial activities. The Project site currently contains a total of 30,923 SF of existing structures which includes a 22,735 SF event/cultural center, 5,338 SF of residential buildings, and 2,850 SF of industrial buildings. The two northern lots are developed with industrial uses while the southern lot is developed with an event/cultural center. The event/cultural center is closed and was vacated in 2021. Additionally, there are two non-conforming residential structures as well as a related parking garage on the southeast corner of the northern parcel. The site is currently accessible via four points of ingress and egress. There are two points of access along North American Way on the western end of the site, one point of access along West Fletcher Avenue at the northwest corner of the site, and an access point at the southwest corner of the site off of the West Freedom Avenue cul-de-sac. The northern, eastern, and southern perimeters are landscaped with palm trees and other ornamental landscaping. Additional hedges and sporadic trees are located throughout the site. The Project site's existing conditions are shown in Figure 3, *Aerial*.

2.3 EXISTING LAND USES AND REGULATORY SETTING OF THE PROJECT SITE

The Project site has a General Plan Land Use designation of Light Industrial (LI) and a zoning designation of Light Industrial (M-1). As it relates to the proposed Project, the Municipal Code states that industrial "allow development of the industrial base needed to make the City a balanced community which provides for local employment opportunities for its residents". Warehouses are a permitted use within this designation.

2.4 SURROUNDING LAND USES

The Project site is located within a developed area and is surrounded by the following land uses:

NORTH: West Fletcher Avenue is located directly north of the Project site followed by a townhouse community. Fletcher Elementary School is across from the northeast corner of the site. The parcels north of the site have a General Plan Land Use designation of Low Medium Residential (LMDR) and Public Facilities (PFI) and zoning designations of Residential Multiple Family (R-3) and Single Family Residential 700 SF (R-1-7).

SOUTH: West Freedom Avenue is located directly south of the Project site followed by Freedom Business Park. The business park has a General Plan Land Use designation of Light Industrial (LI) and an Industrial (M-1) zoning designation.

EAST: North American Way is located directly east of the site followed by an industrial building occupied by Fletcher Coating Company and has a General Plan Land Use designation of Light Industrial (LI) and an Industrial (M-2) zoning designation.

WEST: The Fletcher Basin, a stormwater detention pond abuts the Project site immediately to the west. The basin has a General Plan Land Use designation of Light Industrial (LI) and is zoned as Industrial (M-2).

3 PROJECT DESCRIPTION

3.1 PROPOSED PROJECT

The proposed Project would demolish the existing 30,923 SF of existing structures and construct two new industrial warehouse buildings totaling 97,170 SF. The Project includes the construction of associated parking, landscaping, and utility improvements to serve the site. The building would be utilized for warehousing/distribution uses with associated office space. The proposed site plan is shown on Figure 4, *Conceptual Site Plan*.

Development Summary

The Project would consist of two warehouses totaling 97,170 SF. Building 1 would have a total building area of 50,340 SF inclusive of 2,000 SF of ground floor office space and 2,000 SF of mezzanine. Building 2 would have a total building area of 46,830 SF inclusive of 2,000 SF of ground floor office space and 2,000 SF of mezzanine. Building 1 would measure 40-feet-6-inches in maximum height and Building 2 would measure 40-feet-1-inch maximum in height as pictured in Figure *5, Building Elevations*. The buildings would be situated towards the northern and southern ends of the site with the truck courts facing one another. As shown in Figure *5, Building Elevations*, the proposed buildings would have finish materials in shades of grey with orange accents.

Parking and Loading Summary

The Project would provide a total of 62 parking spaces, 31 per building, which is more than the required 48 spaces required by the Municipal Code. The 62 parking spaces would include 52 standard stalls, 6 accessible stalls for Americans with Disabilities Act compliance, and 4 EV stalls. No trailer parking would be included as part of the Project.

Each building would include 4 dock doors and one grade door for loading and unloading. The exterior loading area would be screened by an 8-foot-high tilt-up concrete screen wall and a 7-foot-high rolling gate.

Landscaping

The Project proposes 25,250 SF of ornamental landscaping that would cover approximately 14.5% of the site. As depicted in Figure 4, *Conceptual Landscaping Plan*, landscaping would include 24-inch box trees, 36-inch box trees, and 15-gallon trees as well as 5-gallon shrubs and groundcover. Landscaping would be provided along the northern, eastern, and western street frontage setbacks and throughout the parking lot area.

The Project would include landscaped setbacks along all three street fronts. A minimum 20-foot setback would be located along the northern end of the site, a 10-foot setback would be located along the eastern perimeter of the site, and a minimum 10-foot-6-inch setback would be located along the western end of the site. Additionally, a landscaped buffer is provided where the parking lot meets the property line.

Fencing and Walls

The Project would construct an 8-foot-high concrete tilt-up screen wall along the western perimeter of the Project site. Additionally, an 8-foot-high concrete tilt-up screen wall with a 7-foot-high rolling

gate would be included on the eastern side of the Project site to screen the truck court from the right-of-way. The gate would include a knox padlock to allow that would meet the standards for emergency vehicles.

Access and Circulation

The site would be accessible via two 40-foot driveways located along the center of the site along North American Way that would be utilized by both personal vehicles and trucks. Additionally, existing sidewalks along the street frontages would remain in place for the Project. New pathways are proposed as part of the Project that would connect the existing sidewalk to the building entrances.

Infrastructure Improvements

Water and Sewer Improvements

The Project applicant would install onsite water lines that would connect to the existing 12-inch diameter water line in North American Way and existing 10-inch diameter water line in West Freedom Avenue. The Project would install onsite sewer lines that would connect to the existing 6-inch and 8-inch diameter sewer lines in North American Way and 6-inch diameter sewer lines in West Freedom Avenue.

Drainage Improvements

The Project proposes a 6-foot drainage easement along the southern perimeter of the Project site and along the southern half of the western perimeter. The Project would construct 12-inch storm drain pipes located within the truck courts that would connect to 18-inch storm drain pipes within the driveways. The storm drain pipes would then connect to new 18-inch drainage infrastructure along the eastern perimeter of the Project site. The 18-inch drain pipe would then connect to an existing curb opening catch basin at the end of the West Freedom Avenue cul-de-sac.

Sidewalk Improvements

The proposed Project would leave the existing 6-foot-wide sidewalks along the street frontages and replace the existing driveways with sidewalks, including a 6-footwide sidewalk along the Project frontage per City standards.

3.2 CONSTRUCTION

Construction activities are to last approximately 15 months. Project construction would include site preparation, demolition, grading, building construction, architectural coating, and paving. The Project's anticipated opening year is early 2024. All off-road diesel construction equipment greater than 50 horsepower (>50 HP) used for construction of the Project would be CARB certified Tier 4 Final or higher, as verified through City permitting for the Project.

3.3 OPERATION

The Project would be operated as an industrial warehouse building. Typical operational characteristics include employees traveling to and from the site, delivery of materials and supplies

to the site, truck loading and unloading, and manufacturing activities. Operation is assumed to be 24 hours a day, 7 days a week.

4 CITY APPROVALS

The Applicant requests City of Orange's approval of the following discretionary actions to implement the proposed Project:

- Major Site Review Approval.
- Design Review Approval.
- Lot Line Adjustment.
- Approval of this Class 32 Exemption.

5.0 EXEMPTION REQUIREMENTS

5.1 CLASS 32 INFILL REQUIREMENTS

Article 19 of the California Environmental Quality Act (CEQA Guidelines Sections 15300 to 15333), includes a list of classes of projects that have been determined to not have a significant effect on the environment and as a result, are exempt from review under CEQA.

Class 32 Infill Exemption
One of the classes of projects exempt from CEQA review are projects that are specified as urban infill development. CEQA Guidelines Section 15332 defines the Class 32 Infill Exemption as a project that meets the following five requirements:

a) The project is consistent with the applicable general plan designation and all applicable general plan policies as well as with applicable zoning designation and regulations.

b) The proposed development occurs within city limits on a project site of no more than five acres substantially surrounded by urban uses.

c) The project site has no value as habitat for endangered, rare or threatened species.

d) Approval of the project would not result in any significant effects relating to traffic, noise, air quality, or water quality.

e) The site can be adequately served by all required utilities and public services.

Exceptions
In addition to meeting the five requirements stated above, the CEQA Guidelines Section 15300.2 provides specific instances where exceptions apply to a project that would otherwise meet the requirements for an exemption. These exceptions are:

a) Location: Classes 3, 4, 5, 6, and 11 are qualified by consideration of where the project is to be located – a project that is ordinarily insignificant in its impact on the environment may in a particularly sensitive environment be significant. Therefore, these classes are considered to apply in all instances, except where the project may impact on an environmental resource of hazardous or critical concern where designated, precisely mapped, and officially adopted pursuant to law by federal, state, or local agencies.

b) Cumulative Impact: All exemptions for these classes are inapplicable when the cumulative impact of successive projects of the same type in the same place, over time is significant.

c) Significant Effects: A categorical exemption shall not be used for an activity where there is a reasonable possibility that the activity will have a significant effect on the environment due to unusual circumstances.

d) Scenic Highways: A categorical exemption shall not be used for a project which may result in damage to scenic resources, including but not limited to, trees, historic buildings, rock outcroppings, or similar resources, within a highway officially designated as a state scenic highway. This does not apply to improvements which are required as mitigation by an adopted negative declaration or certified EIR.

e) Hazardous Waste Sites: A categorical exemption shall not be used for a project located on a site which is included on any list complied pursuant to Section 65962.5 of the Government Code.

f) Historical Resources: A categorical exemption shall not be used for a project which may cause a substantial adverse change in the significance of a historical resources.

6 APPLICABILITY OF CEQA EXEMPTION

6.1 APPLICABILITY OF CLASS 32 EXEMPTION

The analysis below provides substantial evidence that the Project properly qualifies for an exemption under CEQA Guidelines Section 15332 (i.e., Class 32) and, as a result, would not have a significant effect on the environment. Additionally, the analysis shows there are no exceptions to qualifying for the categorical exemption, as identified in CEQA Guidelines Section 15300.2.

a. Criterion Section 15332(a): General Plan and Zoning Consistency: The Project is consistent with the applicable general plan designation and all applicable general plan policies as well as with applicable zoning designation and regulations.

The City of Orange General Plan Land Use designation for the Project site is Light Industrial (LI) and the existing zoning designation of the site is Light Industrial (M-1). The industrial districts "allow development of the industrial base needed to make the City a balanced community which provides for local employment opportunities for its residents" as stated in the Municipal Code.

Table 1 shows the Project's consistency with City of Orange Development Standards found in the Municipal Code Chapter 17.20. As shown, the proposed Project would meet all of the requisite development standards, including FAR, height, setback, and parking requirements. Therefore, the Project would be consistent with the applicable zoning regulations.

Table 1: City of Orange Development Standards

Development Standard	Required	Provided
Parking	0.5 spaces/1,000 SF FA or 49 spaces	62 Spaces
FAR	0.5 – 1.0	0.556
Maximum Structure Height	45 FT	Building 1 – 40' – 6" T.O.P. Building 2 – 40'-1" T.O.P.
Exterior Front, Side, and Rear Yard Setback	20' when across from an alley from a Residential Zone 10' when adjacent to a local street	20' along West Fletcher Avenue, 10' along North American Way, 10'-6" along West Freedom Avenue
Interior Side and Rear Yards	0' when adjacent to a separate parcel	0'

b. Criterion Section 15332(b): Project Location, Size, and Context: The proposed development occurs within city limits on a project site of no more than five acres substantially surrounded by urban uses.

The Project is within the city limits of the City of Orange, on a 4.01-acre site. As shown on Figure 2 and detailed in Section 2.3, the site is surrounded by urban development on all sides. The site is located on North American Way and is surrounded by residential housing and Fletcher Elementary School to the north, industrial development to the east, a business center to the south, and the Fletcher

Basin to the west. As the Project site is less than five acres and surrounded by urban uses, it meets the criteria of CEQA Guidelines Section 15332(b).

c. Criterion Section 15332(c): Endangered, Rare, or Threatened Species: The Project site has no value as habitat for endangered, rare, or threatened species.

The 4.01-acre Project site is currently developed with an event/cultural center, residential buildings, and industrial uses with related infrastructure. The entirety of the site has been disturbed and developed and therefore, the site has no habitat or value for endangered, rare, or threatened species. Additionally, the existing areas along the street frontages are landscaped with ornamental vegetation and no suitable habitat is present for protected species.

The Project site is not within any state or federal Habitat Conservation Plans or Habitat Conservation Plans as shown in the City of Orange General Plan EIR Figure 5.4-2. In addition, the Project site is designated for light industrial uses and is not located within an area designated as open space or considered to have any significant biological habitat as shown in the City's General Plan and zoning maps. No special-status plant species or animal species listed as threatened, endangered, or candidate are located on the site due to lack of suitable habitat.

Therefore, the Project site has no value as habitat for endangered, rare, or threatened species. The Project site includes existing landscaping trees on the site and therefore would comply with Migratory Bird Treaty Act if trees are removed during nesting season and nesting birds are present. For the reasons described above, the proposed Project meets the criteria of CEQA Guidelines Section 15332(c).

Existing Plans, Programs, or Policies

Migratory Bird Treaty Act. Nesting birds are protected pursuant to the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code. If removal of any trees, shrubs, or any other potential nesting habitat are scheduled within the avian nesting season (January 1 to August 31), the City's standard permitting will require a preconstruction clearance survey for nesting birds be completed no more than 3 days prior to ground disturbance. This will ensure that no nesting birds adjacent to the construction area will be disturbed during construction. If nesting birds are found, the City's standard permitting requires an avoidance buffer no less than 300 feet to be established around the nest until all young have fledged and the nest is confirmed by a qualified biologist to be no longer active.

d. Criterion Section 15332(d): Significant Effects: Approval of the Project would not result in any significant effects relating to traffic, noise, air quality, or water quality.

TRAFFIC

The Project proposes the construction of two industrial warehouse buildings with associated office space on the existing developed site. The Project trip generation was prepared using trip rates from the Institute of Transportation Engineers (ITE) *Trip Generation*, 11th Edition (2021).

As shown in Table 2 and discussed in the Trip Generation and VMT Screening Memos prepared by EPD Solutions, Inc. in January 2022 (Appendix A and B), the operation of the proposed Project would generate 166 daily trips including 17 trips during the a.m. peak hour and 17 trips during

the p.m. peak hour which would result in a reduction of 26 daily trips from the existing land use. In addition, passenger car equivalent (PCE) trips were calculated to account for the truck traffic generated by the Project. The Project would generate 6 PCE additional daily trips compared to the existing uses.

Table 2: Project Trip Generation

	Daily	A.M. Peak Hour			P.M. Peak Hour		
		In	Out	Total	In	Out	Total
ITE Trip Rate for Warehouse[1]	1.71	0.13	0.04	0.17	0.05	0.13	0.18
Existing Site Counts	192	4	8	12	9	13	22
Project Trip Generation	166	13	4	17	5	12	17
Total PCE Trip Generation Proposed Project	**243**	**19**	**6**	**25**	**9**	**16**	**25**
Total Net Passenger Vehicle Trip Generation	-26	9	-4	5	-4	-1	-5
Total Net PCE Trip Generation	**6**	**14**	**-4**	**10**	**-2**	**-1**	**-3**

[1]Trip rates from the Institute of Transportation Engineers, Trip Generation, 11th Edition, 2021. Land Use Code 150- Warehousing
Source: Trip Generation Analysis, 2022. Appendix A

The City of Orange has adopted the *Traffic Impact Analysis Guidelines for Vehicles Miles Traveled and Level or Service Assessment* in June of 2020 which provides guidelines for the analysis of transportation impacts under CEQA. The guidelines also provide three types of screening to determine if a project is exempt from a project-level VMT analysis. If a project meets one of the following criteria, then the VMT impact of the project is considered less-than significant and no further analysis of VMT would be required:

- The project is located within a Transit Priority Area.
- The project is located within a low VMT generating area.
- The project type has been identified as having the presumption of a less than significant impact (including small projects that generate less than 110 daily trips).

As shown in the Table 2, the proposed Project would result in -26 daily trips, which is less than the 110 daily trip threshold for small projects. Therefore, the Project would have a less than significant impact on VMT and no further analysis is needed.

The site has existing sidewalks along all three street frontages which would remain as part of the Project. The Project would also construct new sidewalks connecting the existing sidewalk to building entrances. Currently, no bicycle facilities are located within the Project vicinity. Thus, the Project would not conflict with pedestrian or bicycle facilities. Public transit in the Project vicinity is provided by the Orange County Transit Authority (OCTA). Lines 46, Long Beach to Orange, and 153, Brea to Anaheim, are located at the intersection of Taft and Batavia 0.85 miles southwest.

Overall, the proposed Project would not result in any significant effects relating to traffic; therefore, the proposed Project meets the traffic related criteria of CEQA Guidelines Section 15332(d).

NOISE

Noise Terminology

Various noise descriptors are utilized in this noise analysis, and are summarized as follows:

Leq: The equivalent sound level, which is used to describe noise over a specified period of time, typically 1-hour, in terms of a single numerical value. The Leq of a time-varying signal and that of

a steady signal are the same if they deliver the same acoustic energy over a given time. The Leq may also be referred to as the average sound level.

Lmax: The instantaneous maximum noise level experienced during a given period of time.

Lmin: The instantaneous minimum noise level experienced during a given period of time.

Ldn: The Day-Night Average Level (Ldn) is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time of day corrections require the addition of ten decibels to sound levels at night between 10 p.m. and 7 a.m.

CNEL: The Community Noise Equivalent Level, which, similar to the Ldn, is the average A-weighted noise level during a 24-hour day that is obtained after an addition of 4.77 decibels (dBA) to measured noise levels between the hours of 7:00 pm to 10:00 pm. These additions are made to the sound levels at these time periods because during the evening and nighttime hours, when compared to daytime hours, there is a decrease in the ambient noise levels, which creates an increased sensitivity to sounds.

Ambient Noise: The "ambient noise level" is the background noise level associated with a given environment at a specified time and is usually a composite of sound from many sources from many directions.

Noise Regulations

Municipal Code Section 8.24.040-050 outlines exterior noise level standards for fixed noise sources as shown in the Table 3 below.

Table 3: Exterior Noise Standards

Noise Level Descriptor	Daytime (7 a.m. to 10:00 p.m.)	Nighttime (10:00 p.m. to 7:00 a.m.)
Noise Equivalent Level (Leq), dBA	55	45
Maximum Level (Lmax), dBA	70	65

Source: Orange Municipal Code Section 8.24.040

Noise sources associated with construction, repair, remodeling, or grading of any real property are exempt from the above noise level standards provided that said activities take place between the hours of 7:00 a.m. and 8:00 p.m. on any day except for Sunday or Federal Holidays, or between the hours of 9:00 a.m. and 8:00 p.m. on a Sunday or Federal Holiday as stated in Section 8.24.040-050. Noise generated outside of daytime hours are subject to the standards in Table 3.

Existing Conditions

To assess the existing noise level environment, long-term (24-hour) noise level measurements were taken at 3 locations from February 24, 2022 to February 25, 2022, which are shown in Figure 3-4, *Noise Measurement Locations* and further discussed in the Noise and Vibration Impact Analysis, included as Appendix C. A description of these locations and the existing noise levels are provided below in Table 4.

Figure 3-4: Noise Measurement Locations

Table 4: Long-Term 24-Hour Ambient Noise Monitoring Results

Site No.	Site Description	Daytime Noise Levels (dBA L_{eq})	Evening Noise Levels (dBA L_{eq})	Nighttime Noise Levels (dBA L_{eq})	Daily Noise Levels (dBA CNEL)
LT-1	621 Fletcher Avenue, near the southwest corner of the building. Approximately 53 feet north of the Fletcher Avenue centerline.	61.1-64.7	56.7-59.2	47.8-61.8	65.1
LT-2	725 Fletcher Avenue, near the southeast corner of the property. Approximately 36 feet from the Fletcher Avenue centerline.	62.4-67.6	58.0-60.6	50.1-63.9	67.1
LT-3	600 Freedom Avenue, southwest of the building. Approximately 17 feet north of the fence line.	52.1-62.0	50.4-54.2	49.0-64.0	64.4

Source: Noise and Vibration Impact Analysis, 2022, Appendix C

Construction Noise

Because the City does not have construction noise level limits, construction noise for the construction of the proposed Project were assess using criteria from the *Transit Noise and Vibration Impact Assessment Manual* (FTA 2018). Table 5 below shows the FTA's General Assessment Construction Noise Criteria based on the composite noise levels per construction phase.

Table 5: General Assessment Construction Noise Criteria

Land Use	Daytime 1-hour (L_{eq}) (dBA)	Nighttime 1-hour (L_{eq}) (dBA)
Residential	90	80
Commercial	100	100
Industrial	100	100

Source: Noise and Vibration Impact Analysis, 2022. Appendix C

Two types of short-term noise impacts could occur during the construction of the proposed Project. First, construction crew communities and the transport of construction equipment and materials to the site for the proposed Project would incrementally increase noise levels on access roads leading to the site. Although there would be a relatively high single-event noise-exposure potential causing intermittent noise nuisance, the effect on longer-term ambient noise levels could be small when compared to existing daily traffic volumes on Fletcher Avenue. Because construction-related vehicle trips would not reach existing daily traffic volumes, traffic noise would not increase by 3 dBA CNEL. A noise level increase of less than 3 dBA would not be perceptible to the human ear in an outdoor environment. Therefore, short-term construction-related impacts associated with worker commute and equipment transport to the Project site would not be significant.

The second type of short-term noise impact is related to noise generated during excavation, grading, and building erection on the Project site. Construction is completed in discrete steps, each of which includes a mix of equipment with varying noise characteristics. The various sequential phases would change the character of the noise generated on the site and, therefore, the noise levels surrounding the site as construction progresses. Despite the variety in the type and size of construction equipment, similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase. Table 6 provides a list of the construction equipment anticipated to be used during construction based on a distance of 50-feet between the equipment and noise receptor as per the FHWA *Roadway Construction Noise Model* (FHWA 2006). Table 7 shows the nearest sensitive uses to the Project site, their distance from the center of construction activities, and composite noise levels expected during construction.

Table 6: Typical Construction Equipment Noise Levels

Equipment Description	Acoustical Use Factor[1] (%)	Maximum Noise Level (Lmax) at 50 feet[2]
Auger Drill Rig	20	84
Backhoes	40	80
Compactor (ground)	20	80
Compressor	40	80
Cranes	16	85
Dozers	40	85
Dump Trucks	40	84
Excavators	40	85
Flat Bed Trucks	40	84
Forklift	20	85
Front-end Loaders	40	80
Graders	40	85
Impact Pile Drivers	20	95
Jackhammers	20	85
Paver	50	77
Pickup Truck	40	55
Pneumatic Tools	50	85
Pumps	50	77
Rock Drills	20	85
Rollers	20	85
Scrapers	40	85
Tractors	40	84
Trencher	50	80
Welder	40	73

Note: Noise levels reported in this table are rounded to the nearest whole number.
[1] Usage factor is the percentage of time during a construction noise operation that a piece of construction equipment is operating at full power.
[2] Maximum noise levels were developed based on Specification 721.560 from the Central Artery/Tunnel program to be consistent with the City of Boston's Noise Code for the "Big Dig" project.
Source: Noise and Vibration Impact Analysis, 2022. Appendix C

Table 7: Potential Construction Noise Impacts at Nearest Receptor

Receptor (Location)	Composite Noise Level (dBA L_{eq}) at 50 feet	Distance (Feet)	Composite Noise Level (dBA L_{eq})
Industrial Uses (East)	87	165	76
Residences and School (North)		445	68
Residences (South)		715	64

Source: Noise and Vibration Impact Analysis, 2022, Appendix C

While construction noise will vary, it is expected that composite noise levels during construction at the nearest off-site sensitive uses to the north would reach 68 dBA L_{eq}. These predicted noise levels would only occur when all construction equipment is operating simultaneously: and therefore, are assumed to be rather conservative. While construction-related short-term noise levels have the potential to be higher than existing ambient noise levels in the Project area under existing conditions, the noise impacts would no longer occur once Project construction is completed.

As stated above, noise impacts associated with construction activities are regulated by Section 8.24 of the City's Municipal Code. The proposed Project would be required to comply with the

construction hours specified in the Municipal Code, which states that construction activities are allowed between 7:00 a.m. and 8:00 p.m., Monday through Saturday, and 9:00 a.m. to 8:00 p.m. on Sundays and Federal holidays.

As it relates to off-site noise sensitive uses, construction-related noise is anticipated to be a maximum of 68 dBA at the residences and school to the north of the site, which is only 2-3 dBA higher than the existing ambient noise of 65.1 and 67.1 dBA, as shown in Table 4. In addition, impacts would be far below both the 90 dBA L_{eq} and 100 dBA L_{eq} 1-hour construction noise level criteria as established by the FTA for residential and industrial land uses, respectively, for the average daily condition as modeled from the center of the Project site. Therefore, impacts would be less than significant.

Long-Term Off-Site Traffic Noise Impacts
As a result of the implementation of the proposed Project, off-site traffic volumes on surrounding roadways have the potential to increase. The proposed Project trips generated and shown in Table 2 show that the Project would generate an additional 6 PCE daily trips compared to the existing use. With such a small increase in vehicle trips, the Project-related traffic noise increase would be less than 0.1 dBA. This noise level increase would not be perceptible to the human ear in an outdoor environment. Therefore, no traffic noise impacts from Project related traffic on off-site sensitive receptors would occur.

Long-Term Off-Site Stationary Noise Impacts
Adjacent off-site land uses would be potentially exposed to stationary-source noise impacts from the proposed on-site heating, ventilation, air conditioning (HVAC) equipment, truck deliveries and loading and unloading activities. It is assumed that operations would occur equally during all hours of the day and that each loading dock would always be active. As shown in The Noise and Impact Analysis (Appendix C), it was determined that the HVAC equipment could operate 24 hours per day and would generate sound power levels (SPL) of up to 76 dBA SPL at a distance of 165 feet.

The Noise and Vibration Impact Analysis (Appendix C) also determined maximum noise levels for truck deliveries, loading activities, and unloading activities. Maximum noise levels that could occur during the truck docking process were determined 86 dBA L_{max} at a distance of 20-feet. The Project-related noise level impacts would range from 30.3 dBA L_{eq} to 49.0 dBA L_{eq} at the surrounding sensitive receptors. These levels would be below the City's exterior daytime noise standards of 55 dBA L_{eq}. While Project noise level impacts during the nighttime noise hours have the potential to exceed the City's exterior nighttime noise standards of 45 dBA L_{eq}, the quietest ambient noise level during nighttime hours was 50.1 dBA L_{eq} measured at the residential uses where Project impacts would approach 49 dBA L_{eq}. Because the Project noise levels would not exceed the current ambient noise level by 3 dBA or more, long-term off-site stationary noise impacts would be less than significant, and no reduction measures are required.

Aircraft Noise
The proposed Project would not expose people residing or working in the project area to excessive noise levels from aircraft. The nearest airport is John Wayne Airport (JWA), a commercial airport located approximately 9.75 miles south. The Project site is over 9 miles outside the 65 dBA CNEL noise contour of JWA. Additionally, there are no helipads or private airstrips within 2 miles of the Project area. Due to the distance of the Project from the nearest airport, the proposed Project would not expose people residing or working in the Project area to excessive noise levels from aircraft.

Applicable Vibration Standards

The City does not have quantified vibration standards applicable to the proposed Project. However, the FTA's *Transit Noise and Vibration Impact Assessment Manual* (2018) (FTA Manual) provides guidelines for assessing ground-borne vibration impacts on human annoyance. Construction activity can result in varying degrees of ground vibration, depending on the equipment used on the site. Operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Buildings in the vicinity of the construction site respond to these vibrations with varying results ranging from no perceptible effects at the low levels to slight damage at the highest levels. The criteria for environmental impacts from ground-borne vibration and noise are based on the maximum levels for a single event as shown in Table 8 below.

Table 8: Interpretation of Vibration Criteria for Detailed Analysis

Land Use	Max Lv (VdB)[1]	Description of Use
Workshop	90	Vibration that is distinctly felt. Appropriate for workshops and similar areas not as sensitive to vibration.
Office	84	Vibration that can be felt. Appropriate for offices and similar areas not as sensitive to vibration.
Residential Day	78	Vibration that is barely felt. Adequate for computer equipment and low-power optical microscopes (up to 20x).
Residential Night and Operating Rooms	72	Vibration is not felt, but ground-borne noise may be audible inside quite rooms. Suitable for medium-power microscopes (100x) and other equipment of low sensitivity.

1 As measured in 1/3-Octave bands of frequency over the frequency range 8 to 80 Hertz
Source: Noise and Vibration Impact Analysis, 2022. Appendix C

Table 9 below lists the potential vibration building damage criteria associated with construction activities, as suggested by the FTA Manual. FTA guidelines show that a vibration level of up to 0.5 in/sec in peak particle velocity (PPV) is considered safe for buildings consisting of reinforced concrete, steels, or timber, and would not result in any construction vibration damage. For non-engineered timber and masonry buildings, the construction building vibration damage criterion is 0.2 in/sec in PPV.

Table 9: Construction Vibration Damage Criteria

Building Category	PPV (in/sec)
Reinforced concrete, steels, or timber (no plaster)	0.50
Engineered concrete and masonry (no plaster)	0.30
Non-engineered timber and masonry buildings	0.20
Buildings extremely susceptible to vibration damage	0.12

Source: Noise and Vibration Impact Analysis, 2022. Appendix C

Short-Term Construction Vibration Impacts

Construction activities can result in vibration impacts of varying degrees. Table 10 below shows the PPV and vibration velocity decibel (VdB) values at 25-feet from the construction vibration source. As shown below, bulldozers and other heavy-tracked construction equipment, which are expected to be used as part of the Project, generate approximately 0.089 PPV in/sec or 87 VdB of ground-borne vibration when measured at 25-feet, based on the FTA Manual. The distance to the nearest buildings for vibration impact analysis is measured between the nearest off-site buildings and the Project construction boundary.

Table 10: Vibration Source Amplitudes for Construction Equipment

Equipment	Reference PPV/L_v at 25-feet	
	PPV (in/sec)	L_v (VdB)[1]
Pile Driver (Impact), Typical	0.644	104
Pile Driver (Sonic), Typical	0.170	93
Vibratory Roller	0.210	94
Hoe Ram	0.089	87
Large Bulldozer[1]	0.089	87
Caisson Drilling	0.089	87
Loaded Trucks[1]	0.076	86
Jackhammer	0.035	79
Small Bulldozer	0.003	58

[1] RMS vibration velocity in decibels (VdB) is 1 µin/sec.
[2] Equipment shown in **bold** is expected to be used on site.
Source: Noise and Vibration Impact Analysis, 2022. Appendix C

Table 11: Summary of Construction Vibration Levels

Land Use	Direction	Equipment	Reference Vibration Level (VdB) at 25 ft	Reference Vibration Level (PPV) at 25 ft	Distance (ft)[1]	Maximum Vibration Level (VdB)	Maximum Vibration Level (PPV)
Industrial	West	Large Bulldozers	87	0.089	65	75	0.021
Residences	North				105	68	0.010
School	Northeast				165	62	0.005
Office	South				100	69	0.011

[1] Distances reflect the closest single-family residence to the construction equipment in each direction. All other homes in a given direction would experience lower vibration levels.
Source: Noise and Vibration Impact Analysis, 2022. Appendix C

As shown in Table 8 above, the threshold at which vibration levels would result in annoyance would be 78 VdB for residential uses. Based on the information provided in Table 11, vibration levels are expected to approach 68 VdB at the residential uses to the north and 69 VdB at the office uses to the south and would not exceed the annoyance thresholds. Other buildings surrounding the Project site are father away and would experience further reduced vibration. Therefore, no significant construction vibration impacts would occur.

Long-Term Traffic-Related Vibration Impacts

The proposed Project would not generate vibration levels related to on-site operation. In addition, vibration levels generated from the Project-related traffic on the adjacent roadways are unusual for on-road vehicles because the rubber tires and suspension systems of on-road vehicles provide vibration isolation. Vibration levels generated from Project-related traffic on the adjacent roadways would be less than significant and no mitigation measures are required.

AIR QUALITY

Air Quality Management Plan

The Project site is located in the South Coast Air Basin, which is under the jurisdictional boundaries of the South Coast Air Quality Management District (SCAQMD). The SCAQMD and Southern California Association of Governments (SCAG) are responsible for preparing the Air Quality Management Plan (AQMP), which addresses federal and state Clean Air Act (CAA) requirements. The AQMP details goals, policies, and programs for improving air quality in the Basin. In preparation of the AQMP, SCAQMD and SCAG use land use designations contained in General Plan documents to forecast, inventory, and allocate regional emissions from land use and

development-related sources. For purposes of analyzing consistency with the AQMP, if a project's density is consistent with the General Plan, its emissions would be consistent with the assumptions in the AQMP, and the project would not conflict with SCAQMD's attainment plans. In addition, the SCAQMD considers projects consistent with the AQMP if the project would not result in an increase in the frequency or severity of existing air quality violations or cause a new violation.

As discussed previously, the proposed Project would be consistent with the existing land use and zoning designations. As a result, the proposed Project would also be consistent with the assumptions in the AQMP and would not conflict with SCAQMD's attainment plans.

Construction Emissions

Construction activities associated with the proposed Project would generate pollutant emissions from the following: (1) site preparation, grading, and excavation; (2) construction workers traveling to and from Project site; (3) delivery and hauling of construction supplies to, and debris from, the Project site; (4) fuel combustion by onsite construction equipment; (5) building construction; application of architectural coatings; and paving. The amount of emissions generated on a daily basis would vary, depending on the intensity and types of construction activities occurring.

It is mandatory for all construction projects to comply with SCAQMD Rules, including Rule 403 for controlling fugitive dust, PM_{10}, and $PM_{2.5}$ emissions from construction activities. Rule 403 requirements include, but are not limited to, applying water in sufficient quantities to prevent the generation of visible dust plumes, applying soil binders to uncovered areas, reestablishing ground cover as quickly as possible, utilizing a wheel washing system to remove bulk material from tires and vehicle undercarriages before vehicles exit the proposed project site, covering all trucks hauling soil with a fabric cover and maintaining a freeboard height of 12-inches, and maintaining effective cover over exposed areas. Compliance with Rule 403 was accounted for in the construction emissions modeling.

Construction emissions associated with the proposed Project were modeled using CalEEMod as outlined in the Summary of CalEEMod Model Runs and Output prepared by EPD Solutions in April 2022 (Appendix D). As shown in Table 12, the construction emissions generated by the proposed Project would not exceed SCAQMD regional thresholds. Therefore, construction activities would result in a less than significant impact.

Table 12: Construction Emissions Summary

Year	Emissions (pounds per day)					
	ROG	**NO_X**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**
2022 Maximum Daily Emissions	3.2	33.1	21.5	0.0	9.5	5.5
2023 Maximum Daily Emissions	25.8	16.6	20.0	0.0	1.8	1.0
Maximum Daily Emissions 2022-2023	**25.8**	**33.1**	**21.5**	**0.0**	**9.5**	**5.5**

Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Source: Air Quality, Energy, and Greenhouse Gas Impact Analysis. Appendix D

Operational Emissions

Implementation of the proposed warehouse would result in long-term regional emissions of criteria air pollutants and ozone precursors associated with area sources, such as landscaping, applications of architectural coatings, and consumer products. However, operational vehicular emissions would generate the majority of the emissions generated from the Project.

Operational emissions associated with the proposed Project were modeled using CalEEMod and are presented in Table 13 below. As shown, the proposed Project would result in long-term regional emissions of the criteria pollutants that would be below the SCAQMD's applicable thresholds. Therefore, the Project's operational emissions would not result in a significant effect related to regional emissions.

Table 13: Operations Emissions Summary

Operational Activity	ROG	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Area	2.1	0.0	4.3	0.0	0.0	0.0
Energy	0.0	0.1	0.1	0.0	0.0	0.0
Auto Mobile	0.2	0.4	2.9	0.0	1.2	0.3
Truck Mobile	0.1	7.9	2.3	0.1	1.5	0.5
Off Road	0.1	7.1	95.1	0.0	1.1	0.1
Total Project Operational Emissions	2.5	15.5	104.7	0.1	3.8	0.9
Existing Operational Emissions	1.0	1.9	3.9	0.0	1.9	0.5
Total Net Operational Emissions	**1.5**	**13.6**	**100.8**	**0.1**	**1.9**	**0.4**

Local Emissions

In addition, the SCAQMD recommends the evaluation of localized NO_x, CO, PM_{10}, and $PM_{2.5}$ construction-related impacts to sensitive receptors in the immediate vicinity of the Project site. Such an evaluation is referred to as a localized significance threshold (LST) analysis. The impacts were analyzed pursuant to the SCAQMD's Final Localized Significance Threshold Methodology. SCAQMD has developed Local Significance Thresholds (LSTs) that represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standards, and thus would not cause or contribute to localized air quality impacts. LSTs are developed based on the ambient concentrations of NO_x, CO, PM_{10}, and $PM_{2.5}$ pollutants for each of the source receptor areas (SRAs) in the SCAB. The Project site is located in SRA 17, Central Orange County.

As shown in Table 14, with implementation of SCAQMD Rule 403, the maximum daily construction emissions from the proposed Project would not exceed any of the applicable SCAQMD LST thresholds. Therefore, the Project's construction emissions would not result in a significant effect related to localized emissions.

Table 14: Localized Construction Emissions Summary

	CO	NOx	PM_{10}	$PM_{2.5}$
2022	33.1	20.6	9.3	5.4
2023	15.4	17.3	0.7	0.7
Maximum Daily Emission 2022-2023	**33.1**	**20.6**	**9.3**	**5.4**
LST Thresholds	149	984	9.5	5.5
Exceeds Threshold?	**No**	**No**	**No**	**No**

Source: Air Quality, Energy, and Greenhouse Gas Impact Analysis. Appendix D

Furthermore, as demonstrated in Table 15, the Project's operational emissions would not result in a significant effect related to localized emissions.

Table 15: Localized Operational Emission Estimates

Operational Activity	Maximum Daily Regional Emissions (pounds/day)			
	NO_x	CO	PM_{10}	$PM_{2.5}$
Area	0.0	0.0	0.0	0.0
Energy	0.1	0.1	0.0	0.0
Total Mobile	0.7	1.1	0.0	0.0

Energy

The State CEQA Guidelines do not have specific thresholds for Energy consumption. Rather, Appendix G questions if the Project would "result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation." Therefore, for the purpose of the energy analysis, a significant impact would occur if:

- The Project design and/or location encourages wasteful, inefficient, and unnecessary consumption of energy, especially fossil fuels such as coal, natural gas, and petroleum, as well as the use of fuel by vehicles anticipated to travel to and from the Project.

Construction Energy

Due to the Project size and temporary construction period, the electricity used would be substantially less than that required for Project operation and would have a negligible contribution to the Project's overall energy consumption. The electric power used would be for as-necessary lighting and electronic equipment such as computers inside temporary construction trailers. Natural gas is not anticipated to be needed for construction activities. Any consumption of natural gas would be minor and negligible in comparison to the operation of the proposed Project.

The construction equipment associated with construction activities would rely on diesel fuel as would vendor and haul trucks involved in delivering building materials and removing the demolition debris from the Project site. Construction workers would travel to and from the site throughout the duration of construction, and for a conservative analysis, it was assumed that construction workers would travel in gasoline-powered passenger vehicles. Table 16 shows the total fuel usage for the construction of the proposed Project. The construction of the Project and related vehicle fuel usage would be temporary and would not result in impacts to the surrounding vicinity.

Table 16: Estimated Project Vehicle Fuel Usage

Construction Source	Gallons of Diesel Fuel	Gallons of Gasoline Fuel
Construction Vehicles	16.002	30,199
Off-road Construction Equipment	19,748	0
Total	35,750	30,199

Source: Air Quality, Energy, and Greenhouse Gas Impact Analysis. Appendix D

Operational Energy

The operation of the proposed Project would consume electricity, natural gas, and petroleum. The net energy consumption is shown in Table 17 below. The Project is estimated to require less electricity, natural gas, and gasoline than the existing use, while requiring 83,621 more gallons of diesel fuel than the existing use.

Table 17: Project Net Annual Operational Energy Usage

Operational Source	Energy Usage	
Electricity (Kilowatt-Hours)		
Project	402,950	
Existing	345,901	
Net	**57,049**	
Natural Gas (Thousands British Thermal Units)		
Project	379,275	
Existing	312,714	
Net	**66,561**	
Petroleum (gasoline) Consumption		
	Annual VMT	Gallons of Gasoline Fuel
Project	526,711	21,993
Existing	710,000	37,116
Net	**-183,289**	**-15,123**
Petroleum (diesel) Consumption		
	Annual VMT	Gallons of diesel Fuel
Project	601,022	92,691
Existing	159,026	9,370
Net	**441,996**	**83,321**

Source: Air Quality, Energy, and Greenhouse Gas Impact Analysis. Appendix D

The Project's energy consumption for construction activities related to redevelopment of the site for new industrial warehousing uses would be permitted to require compliance with existing fuel standards, machinery efficiency standards, and CARB requirements that limit idling of trucks. Through compliance with existing standards, the Project would not result in the demand for fuel greater on a per-development basis than other development projects in Southern California. There are no unusual Project characteristics that would cause the use of construction equipment that would be less energy efficient compared with other similar construction sites in the State. The operation of the Project is also similar to other industrial projects and would comply with Title 24 as well as all applicable City business and energy codes and ordinances which would provide for efficient energy and water consumption. Therefore, the proposed Project would not result in a conflict with plans, policies, or regulations adopted for the purpose of reducing energy consumption.

Greenhouse Gas Emissions

The analysis methodologies from SCAQMD are used in evaluating potential impacts related to greenhouse gas (GHG) emissions from implementation of the proposed Project. SCAQMD does not have approved thresholds; however, it does have draft thresholds that provide a tiered approach to evaluate GHG impacts. The analysis for the proposed Project utilized tier three which consists of screening values, which the lead agency can choose, but must be consistent with all projects within its jurisdiction. A project's construction emissions are averaged over 30 years and are added to the project's operational emissions. If a project's emissions are below one of the following screening thresholds, then the project impact would be less than significant:

- Option 1: All land use types: 3,000 MT CO_2e per year

- Option 2: Based on land use type: residential: 3,500 MT CO_2e per year; commercial: 1,400 MT CO_2e per year; or mixed use: 3,000 MT CO_2e per year

Construction activities produce combustion emissions from various sources, such as site excavation, grading, utility engines, heavy-duty construction vehicles onsite, equipment hauling materials to and from the site, asphalt paving, and motor vehicles transporting the construction crew. Exhaust emissions from onsite construction activities would vary daily as construction activity levels change.

In addition, operation of the proposed Project would result in area and indirect sources of operational GHG emissions primarily from vehicle trips, offroad activity, and energy consumption. GHG emissions from electricity consumed by the two buildings would be generated off-site by fuel combustion at the electricity provider. GHG emissions from water transport are also indirect emissions resulting from the energy required to transport water from its source.

The Project's construction GHG emissions are shown in Table 18 below and the overall construction and operational emissions are shown in Table 19 and the emissions were calculated using the CalEEMod Model. The construction emissions are amortized over 30 years.

Table 18: Project Construction GHG Emissions

Activity	Annual GHG Emissions ($MTCO_2e$)
2022	171
2023	410
Total Emissions	581
Total Emissions Amortized Over 30 Years	19

Source: Air Quality, Energy, and Greenhouse Gas Impact Analysis. Appendix D

Table 19: Project Total GHG Emissions

Activity	Annual GHG Emissions ($MTCO_2e$)
Project Operational Emissions	
Area	0
Energy	92
Auto Mobile	179
Truck Mobile	808
Offroad	230
Waste	46
Water	84
Total Project Gross Operation Emissions	1,439
Project Construction Emissions	19
Total Emissions	1,458
Existing Emissions	570
Net Project Emissions	**888**
Significance Threshold	3,000
Threshold Exceeded?	**No**

Source: Air Quality, Energy, and Greenhouse Gas Impact Analysis. Appendix D

As shown in Table 19, the proposed Project's net GHG emissions are 888 MTCO2e per year which is below the 3,000 MTCO2e per year threshold. Therefore, the Project would result in a less than

significant GHG impact. Furthermore, the Project would comply with the California Title 24, California Energy Code, and the CALGreen Code, which would provide for efficient energy and water consumption. Therefore, the proposed Project would not result in a conflict with plans, policies, or regulations adopted for the purpose of reducing GHG emissions.

Overall, the proposed warehouse would not result in any significant effects relating to air quality or greenhouse gas emissions; therefore, the proposed Project meets the air quality related criteria of CEQA Guidelines Section 15332(d).

Health Risk Assessment

Construction

A Construction Health Risk Assessment, included as part of Appendix E, was prepared to evaluate the health risk impacts as a result of exposure to DPM as a result of heavy-duty diesel trucks and equipment activities from Project construction. SCAQMD recommends using a 10 in one million cancer risk threshold. A risk level of 10 in one million implies a likelihood that up to 10 people, out of one million equally exposed people would contract cancer if exposed continuously (24 hours per day) to the levels of toxic air contaminants over a specified duration of time. The Construction HRA assumed that Tier 4 or equivalent construction equipment be used for equipment greater than 50 horsepower. As previously discussed, the closest sensitive receptors include the multifamily residences and Fletcher Elementary School located north of the Project. Table 20 below identifies the results of the analysis at the nearest sensitive receptors and onsite workers.

Table 20: Health Risk from Project Construction to Off-Site Receptors

Location	Carcinogenic Inhalation Health Risk in One Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index
Worker Receptor Risk	0.1	0.005	0.000
Sensitive Receptor Risk	4.3	0.003	0.00
SCAQMD Significance Threshold	10 in one million	1.0	1.0
Significant?	No	No	No

Source: Construction Health Risk Assessment, 2022. Appendix E

As shown in Table 20, the cancer risk at the nearest sensitive receptor would be 4.3 in one million, which would not exceed the SCAQMD cancer risk of 10 in one million. Therefore, no significant health risk would occur from Project construction emissions. At this same location, non-cancer risks were estimated to be <0.01, which would not exceed the applicable threshold of 1.0. All other receptors would experience less risk than what is identified for this location. As such, the Project would not cause a significant human health or cancer risk to adjacent land uses as a result of Project construction activity, and impacts would be less than significant.

Operational

A Health Risk Analysis, prepared by LSA in May 2022 included as part of Appendix F, was prepared to evaluate the operational health risk impacts as a result of exposure to DPM as a result of heavy-duty diesel trucks traveling to and from the Project site, maneuvering onsite, and entering and leaving the site during operation of the proposed industrial uses.

The Operational HRA analyzed the potential impacts on the workers and the multifamily residences and Fletcher Elementary School located to the north of the Project, which are the nearest sensitive receptors, and the results are shown in Table 21 below. The residential risk incorporated both the risk of a child living in a nearby residence for 9 years and an adult living in a nearby residence

for 30 years, which is considered a conservative period of time for an individual to live in any one residence.

Table 21: Health Risks from Project Operation to Off-Site Receptors

Location	Carcinogenic Inhalation Health Risk in One Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index
Worker Receptor Risk	0.5	0.002	0.000
Sensitive Receptor Risk	3.6	0.001	0.000
SCAQMD Significance Threshold	10 in one million	1.0	1.0
Significant?	No	No	No

Source: Operational Health Risk Assessment, 2022. Appendix F

As shown in Table 21 above, the maximum cancer risk for the sensitive receptors would be 3.6 in one million, less than the threshold of 10 in one million, which would not exceed the SCAQMD cancer risk threshold of 10 in one million. The worker receptor risk would be lower at 0.5 in one million, which would also not exceed the threshold. The total chronic hazard index would be 0.002 for the worker receptor and 0.001 for the sensitive receptor, which is below the threshold of 1.0. In addition, the total acute hazard index would be nominal (0.000), which would also not exceed the threshold of 1.0. As a result, all health risk levels to nearby residents from operation-related emissions of toxic air contaminants (TACs) would be well below the SCAQMD's HRA thresholds and no significant health risks would occur from Project operation emissions.

WATER QUALITY

The Project site is within the Santa Ana River watershed and under the jurisdiction of the Santa Ana Regional Water Quality Control Board (RWQCB), which sets water quality standards for all ground and surface waters within its region. Water quality standards are defined under the Clean Water Act (CWA) to include both the beneficial uses of specific water bodies and the levels of water quality that must be met and maintained to protect those uses (water quality objectives). Water quality standards for all ground and surface waters overseen by the Santa Ana RWQCB are documented in its Basin Plan, and the regulatory program of the Santa Ana RWQCB is designed to minimize and control discharges to surface and groundwater, largely through permitting, such that water quality standards are effectively attained.

Construction

Construction of the proposed Project would require grading and excavation of soils, which would loosen sediment, and then have the potential to mix with surface water runoff and degrade water quality. Additionally, construction would use heavy equipment and construction-related chemicals, such as concrete, cement, asphalt, fuels, oils, antifreeze, transmission fluid, grease, solvents and paints. These potentially harmful materials could be accidentally spilled or improperly disposed of during construction and, if mixed with surface water runoff could wash into and pollute waters.

These types of water quality impacts during construction of the Project would be prevented through implementation of a grading and erosion control plan that is required for industrial developments (Santa Ana Regional Board Order No. R8-2009-0030), which requires compliance with existing NPDES permits and inclusion of Best Management Practices (BMPs). The use of BMPs during construction implemented as part of a Stormwater Pollution Prevention Plan (SWPPP) as required by the NPDES General Construction Permit would serve to ensure that Project impacts related to construction activities resulting in a degradation of water quality would not be significant. Furthermore, an Erosion and Sediment Transport Control Plan prepared by a qualified SWPPP

developer (QSD) is required to be included in the SWPPP for the Project, and typically includes the following types of erosion control methods that are designed to minimize potential pollutants entering stormwater during construction:

- Prompt revegetation of proposed landscaped/grassed swale areas;
- Perimeter gravel bags or silt fences to prevent off-site transport of sediment;
- Storm drain inlet protection (filter fabric gravel bags and straw wattles), with gravel bag check dams within paved roadways;
- Regular sprinkling of exposed soils to control dust during construction and soil binders for forecasted wind storms;
- Specifications for construction waste handling and disposal;
- Contained equipment wash-out and vehicle maintenance areas;
- Erosion control measures including soil binders, hydro mulch, geotextiles, and hydro seeding of disturbed areas ahead of forecasted storms;
- Construction of stabilized construction entry/exits to prevent trucks from tracking sediment on City roadways;
- Construction timing to minimize soil exposure to storm events; and
- Training of subcontractors on general site housekeeping.

Therefore, compliance with the Statewide General Construction Activity Stormwater Permit requirements, the City's Municipal Code, and other applicable requirements, which would be verified during the City's construction permitting process, would ensure that Project impacts related to construction activities resulting in a degradation of water quality would be less than significant.

Operations

The proposed Project would operate two warehouses on the Project site, which would introduce the potential for pollutants such as, chemicals from cleaners, pesticides and sediment from landscaping, trash and debris, and oil and grease from vehicles. These pollutants could potentially discharge into surface waters and result in degradation of water quality. However, to comply with the Orange County MS4 permit, the proposed Project would be required to incorporate a Water Quality Management Plan (WQMP) with post-construction (or permanent) Low Impact Development (LID) site design, source control, infiltration, and treatment control BMPs.

A Preliminary WQMP for the Project was prepared (included as Appendix G) and includes source control and treatment control BMPs and a LID site design. The source control BMPs would minimize the introduction of pollutants that may result in water quality impacts; and treatment control BMPs that would treat stormwater runoff. The proposed Project would install an onsite infiltration system to treat stormwater, which would remove pollutants including suspended sediments, nitrogen compounds, phosphorus, heavy metals, microbial/viral pathogens, and other toxins. The LID site design would minimize impervious surfaces and provide infiltration of runoff into landscaped areas.

With implementation of the operational source and treatment control BMPs that are outlined in the Preliminary WQMP and required by the City during the Project permitting and approval process, potential pollutants would be reduced to the maximum extent feasible. Plans for grading, drainage, erosion control and water quality would be reviewed by the City's Public Works Department prior to issuance of grading permits to ensure that the applicable and required LID BMPs are constructed during implementation of the Project. Adherence to the existing requirements would ensure that

activities associated with operation of the proposed Project would not result in any significant effects relating to water quality.

Overall, with compliance with existing regulations, which would be verified through the City's permitting process, the proposed warehouse development would not result in any significant effects relating to water quality; therefore, the proposed Project meets the water quality related criteria of CEQA Guidelines Section 15332(d).

e. Criterion Section 15332(e): Utilities: The site can be adequately served by all required utilities and public services.

The utilities necessary to construct and operate the proposed Project (electric, natural gas, trash, water, and sewage) would be adequately provided by existing utility service systems. The Project site is located in an urbanized and developed area. The proposed Project would connect to existing utility service lines within North American Way and West Freedom Avenue. Trash collection services would be arranged prior to the issuance of building permits and would be served by existing landfills. All service confirmations would be addressed prior to occupancy. School public services would not be impacted by the Project since it is an industrial warehouse with no residential uses and would not generate new students. Given the Project size and its location within an area that is currently served by utilities, the Project would be adequately served by all required utilities and public services. Therefore, the proposed Project meets the criteria of CEQA Guidelines Section 15332(e).

7 EXCEPTIONS FOR EXEMPTIONS

In addition to investigating the applicability of CEQA Guidelines Section 15332 (Class 32), this CEQA document also assesses whether any of the exceptions to qualifying for the Class 32 categorical exemption for an Infill Project are present. The following analysis compares the criteria of CEQA Guidelines Section 15300.2 (Exceptions) to the project.

a. Criterion 15300.2(a): Location: Classes 3, 4, 5, 6, and 11 are qualified by consideration of where the project is to be located – a project that is ordinarily insignificant in its impact on the environment may in a particularly sensitive environment be significant. Therefore, these classes are considered to apply all instances, except where the project may impact on an environmental resource of hazardous or critical concern where designated, precisely mapped, and officially adopted pursuant to law by federal, state, or local agencies.

The Project does not qualify for an exemption under Classes 3, 4, 5, 6 or 11. The Project is located within an urban developed area and is not located within a sensitive environment. In addition, the Project would not result in any impacts on an environmental resource of hazardous or critical concern. Therefore, the exception under criterion 15300.2(a) is not applicable.

b. Criterion 15300.2(b): Cumulative Impact: All exemptions for these classes are inapplicable when the cumulative impact of successive projects of the same type in the same place, over time is significant. As mentioned above, the proposed Project does not qualify for an exemption under Classes 3, 4, 5, 6, or 11. As discussed in Section 6 above, the proposed Project would not result in a cumulatively significant impact on the region's air quality or GHG emissions. In addition, the proposed Project would be within the cumulative impacts analyzed in the General Plan EIR. Therefore, the exception under CEQA Guidelines Section 15300.2 (b) does not apply to the Project.

c. Criterion 15300.2(c): Significant Effects: A categorical exemption shall not be used for an activity where there is a reasonable possibility that the activity will have a significant effect on the environment due to unusual circumstances.

There are no known unusual circumstances that are applicable to the Project, and which may result in a significant effect on the environment. Thus, the proposed Project would not be unusual or result in unusual circumstances that would have a significant effect on the environment. Therefore, the exception under CEQA Guidelines Section 15300.2(c) does not apply to the Project.

d. Criterion 15300.2(d): Scenic Highways: Scenic Highways: A categorical exemption shall not be used for a project which may result in damage to scenic resources, including but not limited to, trees, historic buildings, rock outcroppings, or similar resources, within a highway officially designated as a state scenic highway. This does not apply to improvements which are required as mitigation by an adopted negative declaration or certified EIR.

The Project site is not located along an Officially Designated Scenic Highway corridor. The closest Officially Designated State Scenic Highway is a portion of State Route 91 (SR-91), located approximately 2.12 miles northeast of the Project site. The Project site is not visible from SR-91. Thus, development of the Project site would not result in impacts related to any scenic highway corridor. Therefore, the exception under CEQA Guidelines Section 15300.2(d) does not apply to the Project.

e. Criterion 15300.2(e): Hazardous Waste Sites: Hazardous Waste Sites: A categorical exemption shall not be used for a project located on a site which is included on any list complied pursuant to Section 65962.5 of the Government Code.

The site is not on any list pursuant to Section 65962.5 of the Government Code or any other list compiled for purposes related to identifying the prior release of hazardous materials. The site is currently developed with industrial and residential uses in addition to an events/cultural center. A Phase I Environmental Site Assessment for the site was prepared by and is provided in Appendix H, which did not identify any historic hazardous waste releases on site through both a database check and site visit.

The Project is not located on a site which is included on any list complied pursuant to Section 65962.5 of the Government Code. Therefore, the exception under CEQA Guidelines Section 15300.2(e) does not apply to the Project.

f. Criterion 15300.2(f): Historical Resources: A categorical exemption shall not be used for a project which may cause a substantial adverse change in the significance of a historical resources.

The Project site is currently developed with two residential units, industrial structures, and an event/cultural center. Due to the age of the existing structures, a Historic Resource Analysis was completed and is provided in Appendix I. The analysis found that the existing buildings on the site represent the transitionary period of Orange during the last half of the 20th century when the region evolved from a rural and agricultural environment to a commercial/industrial center. The buildings are some of the early structures completed along North American Way and Freedom Avenue from 1948 through 1978. While the buildings are associated with rural and commercial activity in the City, the buildings lack sufficient significance to be found eligible as historic resources. The buildings

are in their original locations and retain integrity of location, however, they do not possess integrity of feeling, setting, or association and no longer convey their historic association with the commercial/industrial development of the City. Thus, the buildings possess low materials, design, and workmanship aspects of integrity. Therefore, the buildings are not eligible for the California Register of Historic Resources and the Project would not destroy, demolish, or alter known historic resources. Project construction would be confined to the site and would not impair the significance of any historic structures. Therefore, the exception under CEQA Guidelines Section 15300.2(e) does not apply to the Project.

On the basis of the evidence provided above, the Project is eligible for a Class 32 Categorical Exemption in accordance with Section 15332, Infill Development Projects, of the CEQA Guidelines. Because the proposed Project meets the criteria for categorically exempt infill development projects listed in CEQA Guidelines Section 15332 and it would not have a significant effect on the environment, this analysis finds that a Notice of Exemption may be prepared for the Project.

From:	Alex J Garber, Associate Transportation Planner
Date:	1/4/2022
Site:	2390 North American Way Warehouse Development
Subject:	Trip Generation Analysis

This technical memorandum provides an evaluation of the proposed industrial project located at 2390 North American Way in the City of Orange. The purpose of this analysis is to determine whether a Level of Service (LOS) or Vehicle Miles Traveled (VMT) Analysis would be required for the project. The existing 4.01-acre site is divided into three lots. The northern 2 lots are currently developed with industrial uses and a residential building, while the southern lot is developed with an event center. The project proposes to demolish the existing buildings and construct two new warehouses totaling 97,170 square feet (sf) (Building 1 – 50,340sf and Building 2 – 46,830sf). The project site plan is shown in Figure 1.

Project Trip Generation

A project trip generation analysis was prepared to determine the potential change in site trip generation resulting from the project. The analysis includes credit for the existing uses calculated from counts taken at the project site (counts attached) and the proposed warehouse trip generation using trip rates from the Institute of Transportation Engineers (ITE), Trip Generation Manual, 11th Edition. Table 1 presents the trip generation estimate for the proposed project.

As shown in Table 1, the existing uses currently generate 192 daily trips including 12 trips during the AM peak hour and 22 trips during the PM peak hour. The City of Orange *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* dated June 2020 ("City of Orange TIA Guidelines") does not have methodology for converting heavy truck trips to passenger car equivalent (PCE) trips. Therefore, the San Bernardino CMP Appendix B – Guidelines for CMP Traffic Impact Analysis Reports (2016) PCE factors were used as they are widely adopted throughout southern California. With PCE factors used, the trip generation of the existing land use would be 237 daily trips including 15 trips during the AM peak hour and 28 trips during the PM peak hour.

The proposed warehouse is forecast to generate 166 daily trips including 17 trips during the AM peak hour and 17 trips during the PM peak hour. With PCE factors used, trip generation would be 243 daily PCE trips including 25 PCE trips during the AM peak hour and 25 PCE trips during the PM peak hour.

The net PCE trip generation for the proposed project is 6 daily trips including 10 PCE trips during the AM peak hour and -3 PCE trips during the PM peak hour.

The City of Orange TIA Guidelines states that a traffic impact analysis (TIA) with LOS analysis is required for projects that meet the following criteria:

- Projects that generate 100 or more trips during any peak hour
- Projects on the Arterial Highway System that generate 1,600 Average Daily Trips
- Projects that will add 51 or more trips during either the AM or PM peak hours to any intersection
- Any project where variations from the standards and guidelines provided in the City of Orange TIA Guidelines are being proposed

- When determined by the City Traffic Engineer that existing or proposed traffic conditions in the project vicinity have unique characteristics that warrant evaluation.

As shown in Table 1, the project would not generate 100 trips during any peak hour, 1,600 daily trips, or add 51 peak hour trips to any intersection. Furthermore, the project would not change the design of any driveways or streets that would conflict with the standards or guidelines of the City of Orange TIA Guidelines. Therefore, the project should be exempt from the requirement to prepare a LOS TIA.

If you have any questions about this analysis, please contact me at (717) 756-1997 or alex@epdsolutions.com.

To:	Brooke Blandino
From:	Alex J Garber, Associate Transportation Planner
Date:	1/4/2022
Site:	2390 North American Way Warehouse Development
Subject:	Vehicle Miles Traveled (VMT) Screening Analysis

This technical memorandum provides an evaluation of the proposed industrial project located at 2390 North American Way in the City of Orange. The purpose of this analysis is to determine whether a Level of Service (LOS) or Vehicle Miles Traveled (VMT) Analysis would be required for the project. The existing 4.01-acre site is divided into three lots. The northern 2 lots are currently developed with industrial uses and a residential building, while the southern lot is developed with an event center. The project proposes to demolish the existing buildings and construct two new warehouses totaling 97,170 square feet. The project site plan is shown in Figure 1.

Vehicle Miles Traveled

Senate Bill (SB) 743 was signed by Governor Brown in 2013 and required the Governor's Office of Planning and Research (OPR) to amend the CEQA Guidelines to provide an alternative to LOS for evaluating Transportation impacts, aiming to promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks and a diversity of land uses. In response, Section 15064.3 - Determining the Significance of Transportation Impacts, was added to the CEQA Guidelines which states that VMT is the most appropriate measure of transportation impacts and shall apply statewide beginning on July 1, 2020.

The City of Orange *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (June 2020) provides guidelines for analysis of transportation impacts under CEQA. The guidelines also provide three types of screening to determine if a project is exempt from project-level VMT analysis. If a project meets one of the following criteria, then the VMT impact of the project is considered less-than significant and no further analysis of VMT would be required:

-The project is located within a Transit Priority Area.
-The project is located within a low VMT generating area.
-The project type has been identified as having the presumption of a less than significant impact (including small projects that generate less than 110 daily trips).

A project trip generation analysis was prepared to determine the potential change in site trip generation resulting from the project. The analysis includes credit for the existing uses calculated from counts taken at the project site (counts attached) and the proposed warehouse trip generation using trip rates from the Institute of Transportation Engineers (ITE), Trip Generation Manual, 11th Edition. Table 1 presents the trip generation estimate for the proposed project.

As shown in Table 1, the existing uses currently generate 192 daily trips including 12 trips during the AM peak hour and 22 trips during the PM peak hour. The proposed warehouse is forecast to generate 166 daily trips including 17 trips during the AM peak hour and 17 trips during the PM peak hour. The net trip generation for the proposed project is -26 daily trips including 5 trips during the AM peak hour and -5 trips during the PM peak hour.

The proposed project would result in 26 fewer daily trips than the existing uses, which is less than the 110 daily trip threshold for small projects. Therefore, the project would be presumed to have a less than significant impact on VMT and no further analysis is needed.

If you have any questions about this analysis, please contact me at (717) 756-1997 or alex@epdsolutions.com.

INTRODUCTION

This noise and vibration impact analysis has been prepared to evaluate the potential noise and vibration impacts and reduction measures associated with the 2390 North American Way Warehouse Project (project) in Orange, California. This report is intended to satisfy the City of Orange (City) requirement for a project-specific noise impact analysis by examining the impacts of the project site and evaluating noise reduction measures that the project may require.

PROJECT LOCATION AND DESCRIPTION

The proposed project would construct two warehouses with total building areas of 50,200 square feet (sf) (Building 1) and 47,300 sf (Building 2). Each building will include a 2,000 sf office, dock doors, and associated parking. Building 1 will be located at the southern end of the property, and Building 2 will be located at the northern end of the property. Each building will span the allowable width of the property. The project is anticipated to be operational in 2023. Typical operational characteristics include employees traveling to and from the site, delivery of materials and supplies to the site, truck loading and unloading, and distribution. The project is assumed to operate 24 hours a day, 7 days a week; however, this may shift depending on the tenant, as the hours of operation are unknown.

The proposed project is located at 2390 North American Way, at the southwest corner of the West Fletcher Avenue and North American Way intersection in the city of Orange. The project site is identified by Assessor's Parcel Numbers 374-632-08, 374-632-07, and 374-632-05. The project site is currently occupied with industrial uses on the north lot, while the southern lot is developed with an event/cultural center. The event/cultural center is closed and has been vacated. Additionally, there are two non-conforming residential homes as well as a related parking garage on the southeast corner of the northern parcel. All existing structures and improvements will be removed prior to grading operations. Figure 1 illustrates the project site location. Figure 2 depicts the proposed project's site plan.

EXISTING LAND USES IN THE PROJECT AREA

The project site is surrounded primarily by residential, commercial, and community facility development. The areas adjacent to the project site include the following uses:

- **North:** Multifamily residences and Fletcher Elementary School, opposite Fletcher Avenue;
- **East:** Industrial uses opposite North American Way;
- **South:** Office/Light Industrial Uses opposite Freedom Avenue and single-family homes further south; and
- **West:** Industrial uses opposite the adjacent water basin.

NOISE AND VIBRATION FUNDAMENTALS

CHARACTERISTICS OF SOUND

Noise is usually defined as unwanted sound. Noise consists of any sound that may produce physiological or psychological damage and/or interfere with communication, work, rest, recreation, and sleep.

To the human ear, sound has two significant characteristics: pitch and loudness. Pitch is generally an annoyance, while loudness can affect the ability to hear. Pitch is the number of complete vibrations, or cycles per second, of a sound wave, which results in the tone's range from high to low. Loudness is the strength of a sound, and it describes a noisy or quiet environment; it is measured by the amplitude of the sound wave. Loudness is determined by the intensity of the sound waves combined with the reception characteristics of the human ear. Sound intensity is the average rate of sound energy transmitted through a unit area perpendicular to the direction in which the sound waves are traveling. This characteristic of sound can be precisely measured with instruments. The analysis of a project defines the noise environment of the project area in terms of sound intensity and its effect on adjacent sensitive land uses.

MEASUREMENT OF SOUND

Sound intensity is measured with the A-weighted decibel (dBA) scale to correct for the relative frequency response of the human ear. That is, an A-weighted noise level de-emphasizes low and very high frequencies of sound, similar to the human ear's de-emphasis of these frequencies. Decibels (dB), unlike the linear scale (e.g., inches or pounds), are measured on a logarithmic scale representing points on a sharply rising curve.

For example, 10 dB is 10 times more intense than 0 dB, 20 dB is 100 times more intense than 0 dB, and 30 dB is 1,000 times more intense than 0 dB. Thirty decibels (30 dB) represents 1,000 times as much acoustic energy as 0 dB. The decibel scale increases as the square of the change, representing the sound pressure energy. A sound as soft as human breathing is about 10 times greater than 0 dB. The decibel system of measuring sound gives a rough connection between the physical intensity of sound and its perceived loudness to the human ear. A 10 dB increase in sound level is perceived by the human ear as only a doubling of the sound's loudness. Ambient sounds generally range from 30 dB (very quiet) to 100 dB (very loud).

Sound levels are generated from a source, and their decibel level decreases as the distance from that source increases. Sound levels dissipate exponentially with distance from their noise sources. For a single point source, sound levels decrease approximately 6 dB for each doubling of distance from the source. This drop-off rate is appropriate for noise generated by stationary equipment. If noise is produced by a line source (e.g., highway traffic or railroad operations), the sound decreases 3 dB for each doubling of distance in a hard site environment. Line source sound levels decrease 4.5 dB for each doubling of distance in a relatively flat environment with absorptive vegetation.

There are many ways to rate noise for various time periods, but an appropriate rating of ambient noise affecting humans also accounts for the annoying effects of sound. The equivalent continuous sound level (L_{eq}) is the total sound energy of time-varying noise over a sample period. However, the predominant rating scales for human communities in the State of California are the L_{eq} and Community Noise Equivalent Level (CNEL) or the day-night average noise level (L_{dn}) based on A-weighted decibels. CNEL is the time-weighted average noise over a 24-hour period, with a 5 dBA weighting factor applied to the hourly L_{eq} for noises occurring from 7:00 p.m. to 10:00 p.m. (defined as relaxation hours) and a 10 dBA weighting factor applied to noises occurring from 10:00 p.m. to 7:00 a.m. (defined as sleeping hours). L_{dn} is similar to the CNEL scale but without the adjustment for events occurring during the relaxation. CNEL and L_{dn} are within 1 dBA of each other and are normally interchangeable. The City uses the CNEL noise scale for long-term traffic noise impact assessment.

Other noise rating scales of importance when assessing the annoyance factor include the maximum instantaneous noise level (L_{max}), which is the highest sound level that occurs during a stated time period. The noise environments discussed in this analysis for short-term noise impacts are specified in terms of maximum levels denoted by L_{max}, which reflects peak operating conditions and addresses the annoying aspects of intermittent noise. It is often used together with another noise scale, or noise standards in terms of percentile noise levels, in noise ordinances for enforcement purposes. For example, the L_{10} noise level represents the noise level exceeded 10 percent of the time during a stated period. The L_{50} noise level represents the median noise level. Half the time the noise level exceeds this level, and half the time it is less than this level. The L_{90} noise level represents the noise level exceeded 90 percent of the time and is considered the background noise level during a monitoring period. For a relatively constant noise source, the L_{eq} and L_{50} are approximately the same.

Noise impacts can be described in three categories. The first category includes audible impacts, which are increases in noise levels noticeable to humans. Audible increases in noise levels generally refer to a change of 3 dB or greater because this level has been found to be barely perceptible in exterior environments. The second category, potentially audible, refers to a change in the noise level between 1 dB and 3 dB. This range of noise levels has been found to be noticeable only in laboratory environments. The last category includes changes in noise levels of less than 1 dB, which are inaudible to the human ear. Only audible changes in existing ambient or background noise levels are considered potentially significant.

Physiological Effects of Noise

Physical damage to human hearing begins at prolonged exposure to sound levels higher than 85 dBA. Exposure to high sound levels affects the entire system, with prolonged sound exposure in excess of 75 dBA increasing body tensions, thereby affecting blood pressure and functions of the heart and the nervous system. In comparison, extended periods of sound exposure above 90 dBA would result in permanent cell damage. When the sound level reaches 120 dBA, a tickling sensation occurs in the human ear, even with short-term exposure. This level of sound is called the threshold of feeling. As the sound reaches 140 dBA, the tickling sensation is replaced by a feeling of pain in the ear (i.e., the threshold of pain). A sound level of 160–165 dBA will result in dizziness or a

loss of equilibrium. The ambient or background noise problem is widespread and generally more concentrated in urban areas than in outlying, less developed areas.

Table A lists definitions of acoustical terms, and Table B shows common sound levels and their sources.

Table A: Definitions of Acoustical Terms

Term	Definitions
Decibel, dB	A unit of sound measurement that denotes the ratio between two quantities that are proportional to power; the number of decibels is 10 times the logarithm (to the base 10) of this ratio.
Frequency, Hz	Of a function periodic in time, the number of times that the quantity repeats itself in 1 second (i.e., the number of cycles per second).
A-Weighted Sound Level, dBA	The sound level obtained by use of A-weighting. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise. (All sound levels in this report are A-weighted unless reported otherwise.)
L_{01}, L_{10}, L_{50}, L_{90}	The fast A-weighted noise levels that are equaled or exceeded by a fluctuating sound level 1%, 10%, 50%, and 90% of a stated time period, respectively.
Equivalent Continuous Noise Level, L_{eq}	The level of a steady sound that, in a stated time period and at a stated location, has the same A-weighted sound energy as the time-varying sound.
Community Noise Equivalent Level, CNEL	The 24-hour A-weighted average sound level from midnight to midnight, obtained after the addition of 5 dBA to sound levels occurring in the evening from 7:00 p.m. to 10:00 p.m. and after the addition of 10 dBA to sound levels occurring in the night between 10:00 p.m. and 7:00 a.m.
Day/Night Noise Level, L_{dn}	The 24-hour A-weighted average sound level from midnight to midnight, obtained after the addition of 10 dBA to sound levels occurring in the night between 10:00 p.m. and 7:00 a.m.
L_{max}, L_{min}	The maximum and minimum A-weighted sound levels measured on a sound level meter, during a designated time interval, using fast time averaging.
Ambient Noise Level	The all-encompassing noise associated with a given environment at a specified time. Usually a composite of sound from many sources from many directions, near and far; no particular sound is dominant.
Intrusive	The noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, time of occurrence, and tonal or informational content, as well as the prevailing ambient noise level.

FUNDAMENTALS OF VIBRATION

Vibration refers to ground-borne noise and perceptible motion. Ground-borne vibration is almost exclusively a concern inside buildings and is rarely perceived as a problem outdoors, where the motion may be discernible, but without the effects associated with the shaking of a building there is less adverse reaction. Vibration energy propagates from a source through intervening soil and rock layers to the foundations of nearby buildings. The vibration then propagates from the foundation throughout the remainder of the structure. Building vibration may be perceived by occupants as the motion of building surfaces, the rattling of items sitting on shelves or hanging on walls, or a low-frequency rumbling noise. The rumbling noise is caused by the vibration of walls, floors, and ceilings that radiate sound waves. Annoyance from vibration often occurs when the vibration exceeds the threshold of perception by 10 dB or less. This is an order of magnitude below the damage threshold for normal buildings.

Typical sources of ground-borne vibration are construction activities (e.g., blasting, pile-driving, and operating heavy-duty earthmoving equipment), steel-wheeled trains, and occasional traffic on rough roads. Problems with both ground-borne vibration and noise from these sources are usually localized to areas within approximately 100 ft from the vibration source, although there are examples of ground-borne vibration causing interference out to distances greater than 200 ft (FTA 2018). When roadways are smooth, vibration from traffic, even heavy trucks, is rarely perceptible. It is assumed for most projects that the roadway surface will be smooth enough that ground-borne

vibration from street traffic will not exceed the impact criteria; however, construction of the project could result in ground-borne vibration that may be perceptible and annoying.

Ground-borne noise is not likely to be a problem because noise arriving via the normal airborne path will usually be greater than ground-borne noise.

Ground-borne vibration has the potential to disturb people and damage buildings. Although it is very rare for train-induced ground-borne vibration to cause even cosmetic building damage, it is not uncommon for construction processes such as blasting and pile-driving to cause vibration of sufficient amplitudes to damage nearby buildings (FTA 2018). Ground-borne vibration is usually measured in terms of vibration velocity, either the root-mean-square (RMS) velocity or peak particle velocity (PPV). The RMS is best for characterizing human response to building vibration, and PPV is used to characterize the potential for damage. Decibel notation acts to compress the range of numbers required to describe vibration. Vibration velocity level in decibels is defined as

$$L_v = 20 \log_{10} [V/V_{ref}]$$

where "L_v" is the vibration velocity in decibels (VdB), "V" is the RMS velocity amplitude, and "V_{ref}" is the reference velocity amplitude, or 1×10^{-6} inches/second (in/sec) used in the United States.

REGULATORY SETTING

APPLICABLE NOISE STANDARDS

The applicable noise standards governing the project site include the criteria in the City's Noise Element of the General Plan (Noise Element) and Section 8.24 of the City of Orange Municipal Code (OMC).

City of Orange

Noise Element of the General Plan

The Noise Element provides the City's goals and policies related to noise, including the land use compatibility guidelines for community exterior noise environments. The Noise Element also sets noise maximum allowable noise exposure standards for transportation sources in Table C and maximum allowable noise exposure standards for stationary sources in Table D below.

In addition, according to the Noise Element, for analysis of noise impacts and determining appropriate mitigation under CEQA, in addition to the maximum allowable noise level standards outlined in Tables C and D, an increase in ambient noise levels is assumed to be a significant noise impact if a project causes ambient noise levels to exceed the following:

- Where the existing ambient noise level is less than 65 dBA, a project-related permanent increase in ambient noise levels of 5 dBA CNEL or greater.

- Where the existing ambient noise level is greater than 65 dBA, a project-related permanent increase in ambient noise levels of 3 dBA CNEL or greater.

Table C: Maximum Allowable Noise Exposure—Transportation Sources

Land Use		CNEL (dBA)	
Designations	**Uses**	**Interior[a,c]**	**Exterior[b]**
Estate Low Density Residential Low Density Residential Low Medium Density Residential	Single-family, duplex, and multiple-family	45	65
	Mobile home park	N/A	65

Source: City of Orange (2015).

Notes:

[a] Interior habitable environment excludes bathrooms, closets, and corridors.

[b] Exterior noise level standard to be applied at outdoor activity areas; such as private yards, patios, or balconies of a multifamily residence. Where the location of an outdoor activity area is unknown or not applicable, the noise standard shall be applied inside the property line of the receiving land use.

[c] Interior noise standards shall be satisfied with windows in the closed position. Mechanical ventilation shall be provided per Uniform Building Code requirements.

[d] Within the Urban Mixed-Use, Neighborhood Mixed-Use, Old Towne Mixed-Use, and Medium Density Residential land use designations, exterior space standards apply only to common outdoor recreational areas.

[e] Within Urban Mixed-Use and Medium Density Residential land use designations, exterior noise levels on private patios or balconies within 250 feet of freeways (I-5, SR-57, SR-55, SR-22, or SR-241) and Smart Streets and Principal Arterials identified in the Circulation and Mobility Element that exceed 70 decibels should provide additional common open space.

dBA = A-weighted decibels
I = Interstate
N/A = not applicable
SR = State Route

Table D: Maximum Allowable Noise Exposure—Stationary Noise Sources

Noise Level Descriptor	Daytime (7:00 a.m. to 10:00 p.m.)	Nighttime (10:00 p.m. to 7:00 a.m.)
Hourly Equivalent Level (L_{eq}), dBA	55	45
Maximum Level (L_{max}), dBA	70	65

Source: City of Orange (2015).
Notes:
[a] These standards apply to new or existing noise-sensitive land uses affected by new or existing nontransportation noise sources, as determined at the outdoor activity area of the receiving land use. However, these noise level standards do not apply to residential units established in conjunction with industrial or commercial uses (e.g., caretaker dwellings).
[b] Each of the noise levels specified above should be lowered by 5 dB for simple-tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises. Such noises are generally considered by residents to be particularly annoying and are a primary source of noise complaints. These noise level standards do not apply to residential units established in conjunction with industrial or commercial uses (e.g. caretaker dwellings).
[c] No standards have been included for interior noise levels. Standard construction practices that comply with the exterior noise levels identified in this table generally result in acceptable interior noise levels.
[d] The City of Orange may impose noise level standards that are more or less restrictive than those specified above based on determination of existing low or high ambient noise levels. If the existing ambient noise level exceeds the standards listed in this table, then the noise level standards shall be increased at 3 dB increments to encompass the ambient environment. Noise level standards incorporating adjustments for existing ambient noise levels shall not exceed a maximum of 70 dBA L_{eq}.
dBA = A-weighted decibels
L_{eq} = equivalent continuous sound level

City of Orange Municipal Code

The City addresses noise in Chapter 8.24, Noise Control, of the OMC. The OMC states that construction noise is exempt from the standards identified in Table D if construction activities occur during the hours of 7:00 a.m. to 8:00 p.m., Monday through Saturday, and during the hours of 9:00 a.m. to 8:00 p.m. on Sundays and federal holidays.

Federal Transit Administration

Because the City does not have construction noise level limits, construction noise was assessed using criteria from the *Transit Noise and Vibration Impact Assessment Manual* (FTA 2018). Table E shows the FTA's General Assessment Construction Noise Criteria based on the composite noise levels per construction phase.

Table E: General Assessment Construction Noise Criteria

Land Use	Daytime 1-hour L_{eq} (dBA)	Nighttime 1-hour L_{eq} (dBA)
Residential	90	80
Commercial	100	100
Industrial	100	100

Source: *Transit Noise and Vibration Impact Assessment Manual* (FTA 2018).
dBA = A-weighted decibels
L_{eq} = equivalent continuous sound level

APPLICABLE VIBRATION STANDARDS

Federal Transit Administration

Vibration standards included in the Federal Transit Administration's (FTA) *Transit Noise and Vibration Impact Assessment Manual* (2018) (FTA Manual) are used in this analysis for ground-borne vibration impacts on human annoyance. The criteria for environmental impact from ground-borne vibration and noise are based on the maximum levels for a single event. Table F provides the criteria for assessing the potential for interference or annoyance from vibration levels in a building.

Table F: Interpretation of Vibration Criteria for Detailed Analysis

Land Use	Max L_v (VdB)[1]	Description of Use
Workshop	90	Vibration that is distinctly felt. Appropriate for workshops and similar areas not as sensitive to vibration.
Office	84	Vibration that can be felt. Appropriate for offices and similar areas not as sensitive to vibration.
Residential Day	78	Vibration that is barely felt. Adequate for computer equipment and low-power optical microscopes (up to 20×).
Residential Night and Operating Rooms	72	Vibration is not felt, but ground-borne noise may be audible inside quiet rooms. Suitable for medium-power microscopes (100×) and other equipment of low sensitivity.

Source: *Transit Noise and Vibration Impact Assessment Manual* (FTA 2018).
[1] As measured in 1/3-Octave bands of frequency over the frequency range 8 to 80 Hertz.
FTA = Federal Transit Administration
VdB = vibration velocity decibels
L_V = velocity in decibels
Max = maximum

Table G lists the potential vibration building damage criteria associated with construction activities, as suggested in the FTA Manual. FTA guidelines show that a vibration level of up to 0.5 in/sec in PPV is considered safe for buildings consisting of reinforced concrete, steel, or timber (no plaster), and would not result in any construction vibration damage. For non-engineered timber and masonry buildings, the construction building vibration damage criterion is 0.2 in/sec in PPV.

Table G: Construction Vibration Damage Criteria

Building Category	PPV (in/sec)
Reinforced concrete, steel, or timber (no plaster)	0.50
Engineered concrete and masonry (no plaster)	0.30
Non-engineered timber and masonry buildings	0.20
Buildings extremely susceptible to vibration damage	0.12

Source: *Transit Noise and Vibration Impact Assessment Manual* (FTA 2018).
FTA = Federal Transit Administration
PPV = peak particle velocity
in/sec = inch/inches per second

OVERVIEW OF THE EXISTING NOISE ENVIRONMENT

The primary existing noise sources in the project area are transportation facilities such as West Fletcher Avenue and North Batavia Street and surrounding commercial, office, and industrial uses.

AMBIENT NOISE MEASUREMENTS

Long-Term Noise Measurements

Long-term (24-hour) noise level measurements were conducted on February 24 and 25, 2022, using three (3) Larson Davis Spark 706RC Dosimeters. Table H provides a summary of the measured hourly noise levels and calculated CNEL level from the long-term noise level measurements. As shown in Table H, the calculated CNEL levels range from 64.4 dBA CNEL to 67.1 dBA CNEL. Hourly noise levels at surrounding sensitive uses are as low as 47.8 dBA L_{eq} during nighttime hours and 52.1 dBA L_{eq} during daytime hours. Long-term noise monitoring survey sheets are provided in Appendix A. Figure 3 shows the long-term monitoring locations.

Table H: Long-Term 24-Hour Ambient Noise Monitoring Results[1]

Location		Daytime Noise Levels[1] (dBA L_{eq})	Evening Noise Levels[2] (dBA L_{eq})	Nighttime Noise Levels[3] (dBA L_{eq})	Daily Noise Levels (dBA CNEL)
LT-1	621 Fletcher Avenue, near the southwest corner of the building. Approximately 53 feet north of the Fletcher Avenue centerline.	61.1-64.7	56.7-59.2	47.8-61.8	65.1
LT-2	725 Fletcher Avenue, near the southeast corner of the property. Approximately 36 feet from the Fletcher Avenue centerline.	62.4-67.6	58.0-60.6	50.1-63.9	67.1
LT-3	600 Freedom Avenue, southwest of the building. Approximately 17 feet north of the fence line.	52.1-62.0	50.4-54.2	49.0-64.0	64.4

Source: Compiled by LSA (2022).
Note: Noise measurements were conducted from February 24 to February 25, 2022, starting at 10:00 a.m.
[1] Daytime Noise Levels = noise levels during the hours from 7:00 a.m. to 7:00 p.m.
[2] Evening Noise Levels = noise levels during the hours from 7:00 p.m. to 10:00 p.m.
[3] Nighttime Noise Levels = noise levels during the hours from 10:00 p.m. to 7:00 a.m.
dBA = A-weighted decibels
L_{eq} = equivalent continuous sound level
CNEL = Community Noise Equivalent Level

EXISTING AIRCRAFT NOISE

Aircraft flyovers may be audible on the project site due to aircraft activity in the vicinity. The nearest airport to the project is John Wayne Airport (JWA), a commercial airport 9.75 miles to the south. The project site is over 9 miles outside the 65 dBA CNEL noise contour of JWA based on the JWA Airport Noise Abatement Program Quarterly Report - January 1, 2021 through March 31, 2021 (County of Orange 2021). Additionally, there are no helipads or private airstrips within 2 miles from the project area. Due to the distance of the project site from the nearest airport, impacts related to aircraft operations are not further discussed in this analysis.

Noise Monitoring Locations

PROJECT IMPACTS

SHORT-TERM CONSTRUCTION NOISE IMPACTS

Two types of short-term noise impacts could occur during the construction of the proposed project. First, construction crew commutes and the transport of construction equipment and materials to the site for the proposed project would incrementally increase noise levels on access roads leading to the site. Although there would be a relatively high single-event noise-exposure potential causing intermittent noise nuisance (passing trucks at 50 ft would generate up to 84 dBA L_{max}), the effect on longer-term ambient noise levels would be small when compared to existing daily traffic volumes on Fletcher Avenue. Because construction-related vehicle trips would not approach existing daily traffic volumes, traffic noise would not increase by 3 dBA CNEL. A noise level increase of less than 3 dBA would not be perceptible to the human ear in an outdoor environment. Therefore, short-term, construction-related impacts associated with worker commute and equipment transport to the project site would be less than significant.

The second type of short-term noise impact is related to noise generated during excavation, grading, and building erection on the project site. Construction is completed in discrete steps, each of which has its own mix of equipment and, consequently, its own noise characteristics. These various sequential phases would change the character of the noise generated on the site and, therefore, the noise levels surrounding the site as construction progresses. Despite the variety in the type and size of construction equipment, similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase. Table I lists typical construction equipment noise levels recommended for noise impact assessments, based on a distance of 50 ft between the equipment and a noise receptor, taken from the FHWA *Roadway Construction Noise Model* (FHWA 2006).

In addition to the reference maximum noise level, the usage factor provided in Table I is used to calculate the hourly noise level impact for each piece of equipment based on the following equation:

$$L_{eq}(equip) = E.L. + 10\log(U.F.) - 20\log\left(\frac{D}{50}\right)$$

where: $L_{eq}(equip)$ = L_{eq} at a receiver resulting from the operation of a single piece of equipment over a specified time period.

E.L. = noise emission level of the particular piece of equipment at a reference distance of 50 ft.

U.F. = usage factor that accounts for the fraction of time that the equipment is in use over the specified period of time.

D = distance from the receiver to the piece of equipment.

Table I: Typical Construction Equipment Noise Levels

Equipment Description	Acoustical Usage Factor (%)[1]	Maximum Noise Level (L_{max}) at 50 Feet[2]
Auger Drill Rig	20	84
Backhoes	40	80
Compactor (ground)	20	80

Source: FHWA Roadway Construction Noise Model User's Guide, Table 1 (FHWA 2006).
Note: Noise levels reported in this table are rounded to the nearest whole number.
[1] Usage factor is the percentage of time during a construction noise operation that a piece of construction equipment is operating at full power.
[2] Maximum noise levels were developed based on Specification 721.560 from the Central Artery/Tunnel program to be consistent with the City of Boston's Noise Code for the "Big Dig" project.
FHWA = Federal Highway Administration
L_{max} = maximum instantaneous sound level

Each piece of construction equipment operates as an individual point source. Using the following equation, a composite noise level can be calculated when multiple sources of noise operate simultaneously:

$$Leq\ (composite) = 10 * \log_{10}\left(\sum_{1}^{n} 10^{\frac{Ln}{10}}\right)$$

Using the equations from the methodology above, the reference information in Table I, and the construction equipment list provided, the composite noise level of each construction phase was calculated. The project construction composite noise levels at a distance of 50 feet would range from 82 dBA L_{eq} to 87 dBA L_{eq} with the highest noise levels occurring during the building construction phase.

Once composite noise levels are calculated, reference noise levels can then be adjusted for distance using the following equation:

$$Leq\ (at\ distance\ X) = Leq\ (at\ 50\ feet) - 20 * \log_{10}\left(\frac{X}{50}\right)$$

In general, this equation shows that doubling the distance would decrease noise levels by 6 dBA while halving the distance would increase noise levels by 6 dBA.

Table J shows the nearest sensitive uses to the project site, their distance from the center of construction activities, and composite noise levels expected during construction. These noise level projections do not take into account intervening topography or barriers. Construction equipment calculations are provided in Appendix B.

Table J: Potential Construction Noise Impacts at Nearest Receptor

Receptor (Location)	Composite Noise Level (dBA L_{eq}) at 50 feet[1]	Distance (feet)	Composite Noise Level (dBA L_{eq})
Industrial Uses (East)	87	165	76
Residences and School (North)		445	68
Residences (South)		715	64

Source: Compiled by LSA (2022).

[1] The composite construction noise level represents the grading phase which is expected to result in the greatest noise level as compared to other phases.

dBA L_{eq} = average A-weighted hourly noise level

While construction noise will vary, it is expected that composite noise levels during construction at the nearest off-site sensitive uses to the north would reach 68 dBA L_{eq}. These predicted noise levels would only occur when all construction equipment is operating simultaneously; and therefore, are assumed to be rather conservative in nature. While construction-related short-term noise levels have the potential to be higher than existing ambient noise levels in the project area under existing conditions, the noise impacts would no longer occur once project construction is completed.

As stated above, noise impacts associated with construction activities are regulated by the City's noise ordinance. The proposed project will be required to comply with the construction hours specified in the City's Noise Ordinance, which states that construction activities are allowed between 7:00 a.m. and 8:00 p.m., Monday through Saturday, and 9:00 a.m. to 8:00 p.m. on Sundays and federal holidays.

As it relates to off-site uses, construction-related noise impacts would remain below the 90 dBA L_{eq} and 100 dBA L_{eq} 1-hour construction noise level criteria as established by the FTA for residential and industrial land uses, respectively, for the average daily condition as modeled from the center of the project site and therefore would be considered less than significant. Best construction practices presented at the end of this analysis shall be implemented to minimize noise impacts to surrounding receptors.

SHORT-TERM CONSTRUCTION VIBRATION IMPACTS

This construction vibration impact analysis discusses the level of human annoyance using vibration levels in VdB and assesses the potential for building damages using vibration levels in PPV (in/sec). This is because vibration levels calculated in RMS are best for characterizing human response to building vibration, while vibration level in PPV is best for characterizing potential for damage.

Table K shows the PPV and VdB values at 25 ft from the construction vibration source. As shown in Table K, bulldozers and other heavy-tracked construction equipment (expected to be used for this project) generate approximately 0.089 PPV in/sec or 87 VdB of ground-borne vibration when measured at 25 ft, based on the FTA Manual. The distance to the nearest buildings for vibration impact analysis is measured between the nearest off-site buildings and the project construction boundary (assuming the construction equipment would be used at or near the project setback line).

Table K: Vibration Source Amplitudes for Construction Equipment

Equipment	Reference PPV/L_V at 25 ft	
	PPV (in/sec)	L_V (VdB)[1]
Pile Driver (Impact), Typical	0.644	104
Pile Driver (Sonic), Typical	0.170	93
Vibratory Roller	0.210	94
Hoe Ram	0.089	87
Large Bulldozer[2]	**0.089**	**87**
Caisson Drilling	0.089	87
Loaded Trucks[2]	**0.076**	**86**
Jackhammer	0.035	79
Small Bulldozer	0.003	58

Source: *Transit Noise and Vibration Impact Assessment Manual* (FTA 2018).
[1] RMS vibration velocity in decibels (VdB) is 1 µin/sec.
[2] Equipment shown in **bold** is expected to be used on site.

µin/sec = microinches per second
ft = foot/feet
FTA = Federal Transit Administration
in/sec = inch/inches per second
L_V = velocity in decibels
PPV = peak particle velocity
RMS = root-mean-square
VdB = vibration velocity decibels

The formulae for vibration transmission are provided below and Table L below provides a summary of off-site construction vibration levels.

$$L_vdB\ (D) = L_vdB\ (25\ ft) - 30\ Log\ (D/25)$$

$$PPV_{equip} = PPV_{ref} \times (25/D)^{1.5}$$

As shown in Table G, the FTA guidelines indicate that for a non-engineered timber and masonry building, the construction vibration damage criterion is 0.2 in/sec in PPV. Based on the information provide in Table L, vibration levels are expected to approach 0.021 at the surrounding structures and would be below the 0.2 PPV in/sec threshold.

Table L: Summary of Construction Vibration Levels

Land Use	Direction	Equipment	Reference Vibration Level (VdB) at 25 ft	Reference Vibration Level (PPV) at 25 ft	Distance (ft)[1]	Maximum Vibration Level (VdB)	Maximum Vibration Level (PPV)
Industrial	West	Large Bulldozers	87	0.089	65	75	0.021
Residences	North				105	68	0.010
School	Northeast				165	62	0.005
Office	South				100	69	0.011

Source: Compiled by LSA (2022).

[1] Distances reflect the closest single-family residence to the construction equipment in each direction. All other homes in a given direction would experience lower vibration levels.

ft = foot/feet
FTA = Federal Transit Administration
in/sec = inch/inches per second
PPV = peak particle velocity
VdB = vibration velocity decibels

As shown in Table F above, the threshold at which vibration levels would result in annoyance would be 78 VdB for daytime residences and 84 VdB for commercial and office type uses. Based on the information provided in Table L, vibration levels are expected to approach 68 VdB at the residential uses to the north and 69 VdB at the office uses to the south and would not exceed the annoyance thresholds.

Other building structures surrounding the project site are farther away and would experience further reduced vibration. Therefore, no construction vibration impacts would occur. No vibration reduction measures are required.

LONG-TERM OFF-SITE TRAFFIC NOISE IMPACTS

As a result of the implementation of the proposed project, off-site traffic volumes on surrounding roadways have the potential to increase. The proposed project trips generated were obtained from the *Trip Generation Analysis for 2390 North American Way Warehouse Development* (EPD Solutions, Inc. 2022). The proposed project would generate six (6) additional daily trips as compared to the existing uses. With such a small increase in vehicle trips, the project-related traffic noise increase would be less than 0.1 dBA. This noise level increase would not be perceptible to the human ear in an outdoor environment. Therefore, no traffic noise impacts from project-related traffic on off-site sensitive receptors would occur. No noise reduction measures are required.

LONG-TERM TRAFFIC-RELATED VIBRATION IMPACTS

The proposed project would not generate vibration levels related to on-site operations. In addition, vibration levels generated from project-related traffic on the adjacent roadways are unusual for on-road vehicles because the rubber tires and suspension systems of on-road vehicles provide vibration isolation. Vibration levels generated from project-related traffic on the adjacent roadways would be less than significant and no mitigation measures are required.

LONG-TERM OFF-SITE STATIONARY NOISE IMPACTS

Adjacent off-site land uses would be potentially exposed to stationary-source noise impacts from the proposed on-site heating, ventilation, and air conditioning (HVAC) equipment and truck deliveries and loading and unloading activities. The potential noise impacts to off-site sensitive land uses from the proposed HVAC equipment and truck delivery activities are discussed below. To provide a conservative analysis, it is assumed that operations would occur equally during all hours of the day and that each loading dock would be always active. To determine the future noise impacts from project operations to the noise sensitive uses, a 3-D noise model, SoundPLAN, was used to incorporate the site topography, shielding from other buildings, and the 8-foot-high wall between the northern and southern buildings on site. A graphic representation of the operational noise impacts is presented in Appendix C.

Heating, Ventilation, and Air Conditioning Equipment

The project would have eight (8) rooftop HVAC units, four (4) on each building. The HVAC equipment could operate 24 hours per day and would generate sound power levels (SPL) of up to 76 dBA SPL, based on manufacturer data (Allied Commercial 2019).

Truck Deliveries and Truck Loading and Unloading Activities

Noise levels generated by delivery trucks would be similar to noise readings from truck loading and unloading activities, which generate a noise level of 75 dBA L_{eq} at 20 ft based on measurements taken by LSA (*Operational Noise Impact Analysis for Richmond Wholesale Meat Distribution Center* [LSA 2016]). Delivery trucks would arrive on site and maneuver their trailers so that trailers would be parked within the loading docks. During this process, noise levels are associated with the truck engine noise, air brakes, and back-up alarms while the truck is backing into the dock. These noise levels would occur for a shorter period of time (less than 5 minutes). After a truck enters the loading dock, the doors would be closed and the remainder of the truck loading activities would be enclosed and therefore much less perceptible. To present a conservative assessment, it is assumed that unloading activities could occur at all ten (10) docks simultaneously for a period of more than 30 minutes in a given hour. Maximum noise levels that occur during the docking process taken by LSA were measured to be 86 dBA L_{max} at a distance of 20 feet.

Tables M and N below show the combined hourly noise levels generated by HVAC equipment and truck delivery activities at the closest off-site land uses. The project-related noise level impacts would range from 30.3 dBA L_{eq} to 49.0 dBA L_{eq} at the surrounding sensitive receptors. These levels would be below the City's exterior daytime noise standard of 55 dBA L_{eq}. While project noise level impacts during the nighttime noise hours have the potential to exceed the City's exterior nighttime noise standard of 45 dBA L_{eq}, the quietest ambient noise level during nighttime hours was 50.1 dBA L_{eq} measured at the residential uses where project impacts would approach 49.0 dBA L_{eq}. Because project noise levels would not exceed the current ambient noise level by 3 dBA or more, the impact would be less than significant and no noise reduction measures are required.

Table M: Daytime Exterior Noise Level Impacts

Receptor	Direction	Existing Quietest Daytime Noise Level (dBA L_{eq})	Project Generated Noise Levels (dBA L_{eq})	Potential Operational Noise Impact?[1]
School	Northeast	56.7	44.0	No
Residential	North	58.0	49.0	No
Residential	South	50.4	30.3	No

Source: Compiled by LSA (2022).
[1] A potential operational noise impact would occur if (1) the quietest daytime ambient hour is less than 55 dBA Leq and project noise impacts are greater than 55 dBA Leq, OR (2) the quietest daytime ambient hour is greater than 55 dBA Leq and project noise impacts are 3 dBA greater than the quietest daytime ambient hour.
dBA = A-weighted decibels
L_{eq} = equivalent noise level

Table N: Nighttime Exterior Noise Level Impacts

Receptor	Direction	Existing Quietest Nighttime Noise Level (dBA L_{eq})	Project Generated Noise Levels (dBA L_{eq})	Potential Operational Noise Impact?[1]
School[2]	Northeast	-	-	-
Residential	North	50.1	49.0	No
Residential	South	49.0	30.3	No

Source: Compiled by LSA (2022).
[1] A potential operational noise impact would occur if (1) the quietest nighttime ambient hour is less than 45 dBA Leq and project noise impacts are greater than 45 dBA Leq, OR (2) the quietest nighttime ambient hour is greater than 45 dBA Leq and project noise impacts are 3 dBA greater than the quietest nighttime ambient hour.
[2] This analysis assumes the school is not in typical daily operations between the hours of 10:00 p.m. and 7:00 a.m. the next day.
dBA = A-weighted decibels
L_{eq} = equivalent noise level

In addition to hourly noise level impacts, as stated above, maximum noise levels are created for short durations when the docking process occurs. To be conservative, LSA assumed that two (2) trucks have the potential to dock simultaneously, one at each building. Table O shows the maximum noise levels generated by truck docking activities at the closest off-site land uses. The results of Table O show that maximum noise levels generated by loading dock activities would be less than both of the City's daytime and nighttime maximum noise level standards; therefore, the impact would be less than significant and no noise reduction measures are required.

Table O: Maximum Exterior Noise Level Impacts

Receptor	Direction	Project-Related Noise Impacts (dBA L_{max})	City Standards Daytime/Nighttime (dBA L_{max})	Potential Operational Noise Impact?[1]
School	Northeast	58.5	70 / 65	No
Residential	North	59.7	70 / 65	No
Residential	South	40.9	70 / 65	No

Source: Compiled by LSA (2022).
[1] A potential maximum operational noise impact would occur if maximum noise levels exceed either of the City's daytime or nighttime maximum noise level standards.
dBA = A-weighted decibels
L_{max} = maximum noise level

BEST CONSTRUCTION PRACTICES

In addition to compliance with the City's Municipal Code allowed hours of construction of 7:00 a.m. to 8:00 p.m., Monday through Saturday, and 9:00 a.m. to 8:00 p.m. on Sundays and federal holidays, the following best construction practices would further minimize construction noise impacts:

- The project construction contractor shall equip all construction equipment, fixed or mobile, with properly operating and maintained noise mufflers consistent with manufacturer's standards.
- The project construction contractor shall locate staging areas away from off-site sensitive uses during the later phases of project development.
- The project construction contractor shall place all stationary construction equipment so that emitted noise is directed away from sensitive receptors nearest the project site whenever feasible.

Re: Air Quality, Energy, and Greenhouse Gas Impact Analysis for the 2390 North American Way Development

---

This technical memorandum presents an analysis of the air quality, energy, and greenhouse gas (GHG) impact for the proposed 2390 North American Way Redevelopment Project (proposed project; project), located on the southwest corner of North American Way and Fletcher Avenue in the City of Orange. The project proposes to demolish the existing structures on the site, which consist of two existing single family residential units with a detached garage, a pallet manufacturing operation, and event/cultural center building, and construct two speculative warehouses totaling 97,500 SF, parking lot, ornamental landscaping, and associated infrastructure on a 4.01-acre site. The project site is shown in Figure 1 Project Site. A subsequent site plan shows a reduction of 330 SF (97,170 SF); however, the previous analysis was maintained to show a conservative analysis.

To support the CEQA document for the proposed project, this report analyzes the proposed project's construction and net operational impacts to air quality (emission of criterial pollutants) emissions using the California Emissions Estimator Model (CalEEMod) land use emission model. Table 1 shows the estimated construction schedule, which is expected to last about 15 months.

Table 1. Construction Schedule

Activity	Start Date	End Date	Total Days
Demolition	9/1/2022	11/9/2022	50
Site Preparation	11/10/2022	11/23/2022	10
Grading	11/24/2022	12/5/2022	8
Building Construction	12/6/2022	10/23/2023	230
Paving	8/16/2023	11/16/2023	18
Architectural Coating	11/17/2023	12/12/2023	18

Source: CalEEMod Sheets

Summary of Air Quality, Energy and GHG Impacts

Air Quality:

The project's maximum daily emissions (regional and local) for construction and net operation of the project would not exceed the South Coast Air Quality Management District's (SCAQMD) regional thresholds of significance. In addition, all construction activities would comply with applicable SCAQMD rules and regulations, including Rule 403 to minimize fugitive PM dust emissions and Rule 1113 which allows only Low-Volatile Organic Compounds (VOC) paints. Projects that do not exceed the regional thresholds are assumed to not have a significant impact on a project level and cumulative level. Therefore, the proposed project would have less than significant air quality impacts.

Energy:

The project's energy consumption for construction activities related to redevelopment of the site for new industrial warehousing uses would be permitted to require compliance with existing fuel standards,

machinery efficiency standards, and CARB requirements that limit idling of trucks. Through compliance with existing standards the Project would not result in demand for fuel greater on a per-development basis than other development projects in Southern California. There are no unusual project characteristics that would cause the use of construction equipment that would be less energy efficient compared with other similar construction sites in other parts of the State. The operation of the project is also similar to other industrial projects and would comply with Title 24 as well as all applicable City business and energy codes and ordinances.

GHG:
Finally, the proposed project's net GHG emissions of 888 $MTCO_2e$ per year are below the SCAQMD significance threshold of 3,000 $MTCO_2e$ per year. Therefore, the project has a less then significant impact on GHG emissions.

Air Quality Impact Tables

Methodology and Model Inputs
To calculate the net operational impacts, the existing use air quality analysis emissions was run using CalEEMod (v2020.4.0). In addition, counts were taken at the project driveways to calculate an accurate trip generation using the *Trip Generation Manual*. For the proposed project, ITE *Trip Generation Manual* 11th Edition rates for warehouse (Land Use Code 150) was used over the CalEEMod default of the Institute of Transportation Engineers (ITE) *Trip Generation Manual* 10th Edition rates for warehouse.

The area, energy, and mobile emissions were calculated for the existing use and proposed project. The area CalEEMod defaults were used except for paints to conform to SCAQMD Rule 1113, which only allows the use of Low-Volatile Organic Compounds (VOC)" paints (no more than 50 gram/liter (g/L) of VOC). Southern California Edison CalEEmod defaults were used for the energy calculation. Finally, for mobile emissions, CalEEMod Defaults were used for trip lengths except for three and four+ axle trucks, medium heavy duty and heavy heavy duty respectively, a trip length of 40 miles[1] was used. The existing and proposed projects daily trip rate was provided by the project's *Vehicle Miles Traveled Screening Analysis* (EPD Solutions 2022), and the South Coast Air Quality Management District *Warehouse Truck Trip Study Data Results and Usage* (SCAQMD 2014) was utilized for the warehouse vehicle splits. Table 2 provides the breakdown of the details used for the analysis for each facility.

Regional Emissions

The SCAQMD has adopted maximum daily emission thresholds[2] (pounds/day) for the criteria pollutants during construction and operation of a project. While incremental regional air quality impacts of an individual project are generally very small and difficult to measure, SCAQMD's regional maximum emission thresholds set standards to reduce the burden of SCAQMD to attain and maintain ambient air quality standards. The regional thresholds apply to the criteria pollutants mentioned above and can be found in Table 3: *Regional Construction Emissions Estimates* and Table 4: *Regional Net Operational Emissions Estimates* along with the CalEEMod projects emissions. These emission thresholds include the project emissions generated both from onsite sources (such as off-road construction equipment and fugitive dust) and offsite sources (vehicle travel leaving and arriving to the site). As shown in Table 3 and Table 4, the project would have less then significant regional air quality impacts.

Local Emissions

Localized significance thresholds (LSTs) were also adopted by the SCAQMD due to project-related construction or operational air emissions having the potential to exceed the state and national air quality standards in the project vicinity, while not exceeding the regional emission significance thresholds adopted by the SCAQMD. These thresholds set the maximum rates of daily construction or operational emissions from a project site that would not exceed a national or State ambient air quality standard[3]. The differences between regional thresholds and LSTs are as follows:

[3] SCAQMD 2008: Final Localized Significance Threshold Methodology. Referenced on 9/3/2020 at http://www.aqmd.gov/docs/defaultsource/ceqa/handbook/localized-significance-thresholds/final-lst-methodology-document.pdf

1. Regional thresholds include all sources of project construction and operational emissions generated from onsite and offsite emission sources whereas the LSTs only consider the emissions generated from onsite emission sources.
2. LSTs only apply to CO, NO_x, PM_{10}, and $PM_{2.5}$, while regional thresholds include both ROG and SO_x.
3. Regional Thresholds apply to emission sources located anywhere within the SCAQMD whereas the LSTs are location dependent and also depend on the size of the project, and emission location relative to the nearest sensitive receptor.

A sensitive receptor is defined as an individual who is most susceptible to negative health affects when exposed to air pollutants including children, the elderly, and adults with chronic health issues. Such receptors include residences, schools, elderly care centers, and hospitals. SCAQMD provides screening look up tables (Appendix C of the SCAQMD 2008 Final Localized Significance Threshold Methodology)[4] for projects that disturb less than or equal to 5 acres in size in a day. These tables were created to easily determine if the daily emissions of NO_x, CO, PM_{10}, and $PM_{2.5}$ from a project could result in a significant impact to the local air quality. The thresholds are determined by:

- Source receptor area (SRA), the geographic area within the SCAQMD that can act as both a source of emissions and a receptor of emission impacts (project is located within SRA 17, Central Orange County),
- Size of grading disturbance (construction)/size of the project (operation),
- Distance to the nearest sensitive receptor.

The phase with the most ground disturbance would be the site preparation phase, which would grade 3.5 acres per day, so 3.5 acres was used for the look up tables. The thresholds for 3.5 acres were interpolated from Appendix C using the thresholds for 2 acres and 5 acres. Distance to the nearest sensitive receptor also determines the emission thresholds. The sensitive receptors closest to the project include residential homes north of the project boundary, about 26.27 meters (86.18 feet), and an elementary school northeast from the project boundary, about 49.21 meters (161.46 feet). The minimum distance provided in the lookup tables (25 meters, 82 feet) was used. Table 5: *Localized Construction Emission Estimates* shows the thresholds and estimated maximum daily construction emissions for the proposed project. As seen in Table 5, the proposed project has a less then significant localized construction air quality impact.

The LSTs for Operation are determined by the size of the project site and the distance to the nearest sensitive receptor. The proposed project is 4.01 acres; therefore, the LST 4 acre thresholds were interpolated from the 2 acre and 5 acre thresholds. No credit was taken from the existing use for the LST analysis. As shown in Table 6, the proposed project has a less than significant localized operational air quality impact.

Energy

The State CEQA Guidelines do not have specific thresholds for Energy consumption. Rather, the question in Appendix G: VI Energy (a) asks, "[Does the proposed project] Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation?". Therefore, for the purpose of this analysis, a significant impact would occur if:

- The Project design and/or location encourages wasteful, inefficient, and unnecessary consumption of energy, especially fossil fuels such as coal, natural gas, and petroleum, as well as the use of fuel by vehicles anticipated to travel to and from the project.

The following assumptions were used to calculate the energy consumption of the proposed project:

- The project's construction and operational energy consumption would be provided by Southern California Edison Company.
- Construction equipment fuel consumption derived from Air Resources Board (ARB) Offroad2021 emission model
- Fuel Consumption from vehicle travel derived from ARB EMFAC2021 emission model
- Electrical and natural gas usage derived from the CalEEMod model

Construction

Electricity and Natural Gas Usage:

Due to the project size and the fact that construction is temporary, the electricity used would be substantially less than that required for project operation and would have a negligible contribution to the project's overall

energy consumption. The electric power used would be for as-necessary lighting and electronic equipment such as computers inside temporary construction trailers. Natural gas is not anticipated to be needed for construction activities. Any consumption of natural gas would be minor and negligible in comparison to the operation of the proposed project.

Petroleum Fuel Usage:
The construction equipment associated with construction activities (off-road/heavy duty vehicles) would rely on diesel fuel as would vendor and haul trucks involved in delivering building materials and removing the demolition debris from the project site. Construction workers would travel to and from the project site throughout the duration of construction, and for a conservative analysis it is assumed that construction workers would travel in gasoline-powered passenger vehicles.

Table 7 used the total fuel consumption and horsepower-hour data contained within the ARB OffRoad2021 emission model for specific types of diesel construction equipment. It should be noted that the total fuel consumption is a conservative analysis and would likely overstate the amount of fuel usage, as specific construction equipment is not expected to operate during the duration of the construction activity (i.e., crane). Table 8 summarizes the project's construction vehicle fuel usage based on vehicle miles traveled and fuel usage factors contained in the ARB EMFAC2021. The trips included are worker vehicles, vendor vehicles, and haul vehicles. Table 9 shows the overall fuel consumption for construction of the proposed project.

Operation

The operation of the proposed project would consume electricity, natural gas, and petroleum. The net energy consumption can be found in Table 10, below. Electricity and natural gas consumption were found in the Annual CalEEMod Output Sheets attached. The gasoline consumption rates utilize the same assumptions that were used for the worker vehicles. As shown in Table 10, the project is estimated to require less electricity, natural gas, and gasoline then the existing use, while requiring 83,623 more gallons of diesel fuel then the existing use.

Conclusion

The project's energy consumption for construction activities related to redevelopment of the site for new industrial warehousing uses would be permitted to require compliance with existing fuel standards, machinery efficiency standards, and CARB requirements that limit idling of trucks. Through compliance with existing standards the Project would not result in demand for fuel greater on a per-development basis than other development projects in Southern California. There are no unusual project characteristics that would cause

the use of construction equipment that would be less energy efficient compared with other similar construction sites in other parts of the State. The operation of the project is also similar to other industrial projects and would comply with Title 24 as well as all applicable City business and energy codes and ordinances.

Greenhouse Gas

SCAQMD has convened a Greenhouse Gas Emissions (GHG) CEQA Significance Threshold Working Group to help lead agencies determine significance thresholds for GHG emissions when SCAQMD is not the lead agency. The last working group was held September 2010 (Meeting No. 15)[5] and proposed a tiered approach, equivalent to the existing consistency determination requirements in CEQA Guidelines Sections 15064(h)(3), 15125(d), or 15152(a). The most recent proposal issued in Meeting No. 15 uses a tiered approach, Tier 1 to Tier 5, to evaluate potential GHG impacts from various uses. This assessment will apply the Tier 3: Numerical Screening Thresholds approach. Tier three consists of screening values, which the lead agency can choose, but must be consistent with all projects within its jurisdiction. A project's construction emissions are averaged over 30 years and are added to the project's operational emissions. If a project's emissions are below one of the following screening thresholds, then the project impact would be is less than significant:

- Option 1: All land use types: 3,000 MT CO_2e per year
- Option 2: Based on land use type: residential: 3,500 MT CO_2e per year; commercial: 1,400 MT CO_2e per year; or mixed use: 3,000 MT CO_2e per year

Executive Order S-3-05's year 2050 goal is the basis of SCAQMD' draft Tier 3 screening level thresholds. The objective of the Executive Order is to contribute to capping worldwide CO_2 concentrations at 450 ppm, stabilizing global climate change. The City of Orange utilizes Option 1, and therefore the threshold is 3,000 MT CO_2e per year.

The project's construction GHG emissions are shown in Table 11, and the overall construction and operational emissions are shown in Table 12, below. These emissions were calculated using the CalEEMod Model. The construction emissions are amortized over 30 years. As shown in Table 12, the proposed project's net GHG emissions are 888 $MTCO_2e$ per year, below the 3,000 MT CO_2e per year. Therefore, the project would have a less than significant GHG impact.

INTRODUCTION

LSA has prepared this construction health risk assessment (HRA) for the proposed 2390 North American Way Warehouse Project (project) in Orange, California.

An HRA is a process used to estimate the increased health risk levels for people living and/or working near a project that emits toxic air contaminants (TACs). An HRA combines results of studies on the health effects of various animal and human exposure to TACs with results of studies that estimate the exposure levels at different distances from the source of pollutants. The purpose of the HRA is to document the increased cancer and noncancer health risk levels from project-related emissions of TACs on existing nearby sensitive receptors, including residents and/or workers.

The City of Orange (City) recommends the preparation of an HRA in accordance with policies and procedures of the State Office of Environmental Health Hazard Assessment (OEHHA) and the South Coast Air Quality Management District (SCAQMD). This HRA evaluates all of these criteria in compliance with applicable requirements.

PROJECT LOCATION AND DESCRIPTION

The proposed project would construct two warehouses with total building areas of 50,200 square feet (sf) (Building 1) and 47,300 sf (Building 2). Each building would include a 2,000 sf office, dock doors, and associated parking. Building 1 would be located at the southern end of the property, and Building 2 would be located at the northern end of the property. Each building would span the allowable width of the property. Typical operational characteristics include employees traveling to and from the site, delivery of materials and supplies to the site, truck loading and unloading, and distribution. The project is assumed to operate 24 hours a day, 7 days a week; however, this may shift depending on the tenant, as the hours of operation are unknown.

The proposed project is located at 2390 North American Way, at the southwest corner of the West Fletcher Avenue and North American Way intersection in the city of Orange. The project site is identified by Assessor's Parcel Numbers (APNs) 374-632-08, 374-632-07, and 374-632-05. The project site is currently occupied with industrial uses on the north lot, while the southern lot is developed with an event/cultural center. The event/cultural center is closed and has been vacated. Additionally, there are two non-conforming residential homes as well as a related parking garage on the southeast corner of the northern parcel. All existing structures and improvements would be removed prior to grading operations. Figure 1 illustrates the project site location. Figure 2 depicts the proposed project's site plan.

Construction of the project would begin September 2022 and end December 2023. The project is anticipated to be operational by the end of 2023. All equipment greater than 50 horsepower would be rated Tier 4 or equivalent.

EXISTING LAND USES IN THE PROJECT AREA

For the purposes of this analysis, sensitive receptors are areas of the population that have an increased sensitivity to air pollution or environmental contaminants. Sensitive receptor locations include residences, schools, daycare centers, hospitals, parks, and similar uses that are sensitive to air quality. Impacts on sensitive receptors are of particular concern because those receptors are the population most vulnerable to the effects of air pollution. The project site is surrounded primarily by residential, commercial, and community facility development. The areas adjacent to the project site include the following uses:

- **North:** Multifamily residences and Fletcher Elementary School, opposite Fletcher Avenue;
- **East:** Industrial uses opposite North American Way;
- **South:** Office/Light Industrial Uses opposite Freedom Avenue and single-family homes further south; and
- **West:** Industrial uses opposite the adjacent water basin.

The closest sensitive receptors include the multifamily residences and Fletcher Elementary School, opposite Fletcher Avenue approximately 445 feet north of the project site. The closest worker receptors include the industrial uses opposite North American Way, approximately 165 feet east of the project site.

BACKGROUND

This section provides a discussion of regulatory guidance from the California Air Resources Board (CARB), the OEHHA, the California Air Pollution Control Officers Association (CAPCOA), and the SCAQMD.

CALIFORNIA AIR RESOURCES BOARD HANDBOOK AND TECHNICAL ADVISORY

CARB has developed an *Air Quality and Land Use Handbook* (CARB Handbook;)[1] and a supplement, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*[2], which are intended to serve as general reference guides for evaluating and reducing air pollution impacts associated with new projects that are part of the land use decision-making process. According to the CARB Handbook, recent air pollution studies have shown an association between both respiratory and other noncancer health effects and proximity to high-traffic roadways and other land uses associated with high volume truck traffic. Other studies have shown that diesel exhaust and other cancer-causing chemicals emitted from cars and trucks are responsible for much of the overall cancer risk from airborne toxics in California. The CARB Handbook recommends that planning agencies recognize that the configuration of warehouse and distribution centers can reduce population exposure and risk. For example, locating the main entry and exit points away from sensitive land uses helps to reduce cancer risks and other health impacts.

OFFICE OF ENVIRONMENTAL HEALTH AND HAZARD ASSESSMENT GUIDELINES

The OEHHA developed the *Air Toxics Hot Spots Program Guidance Manual*[3] in conjunction with the CARB for use in implementing the Air Toxics Hot Spots Program (Health and Safety Code Section 44360). The manual describes health effect values, exposure pathway variates (e.g., breathing rates), and a tiered approach for performing HRAs based on current science and policy assessment. The intent of the guidance manual is to incorporate children's health concerns, update risk assessment practices, and provide consistent risk assessment procedures.

CALIFORNIA AIR POLLUTION CONTROL OFFICERS ASSOCIATION

In 2009, the CAPCOA published guidance[4] on assessing the health risk impacts from and to proposed land use projects, focusing on the acute, chronic, and cancer impacts of sources affected by California Environmental Quality Act (CEQA). The document recommends procedures to identify when a project should undergo further risk evaluation, procedures for conducting an HRA,

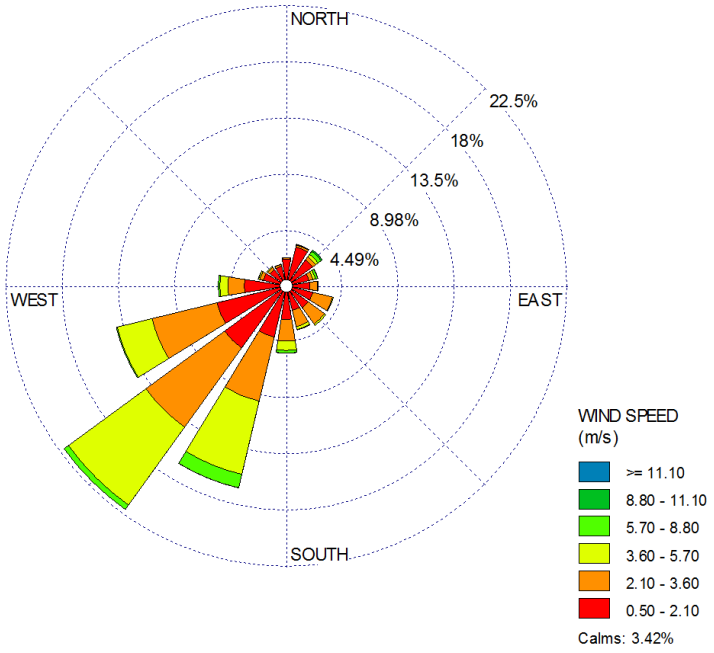
SETTING

REGIONAL AIR QUALITY

The project site is in the City of Orange, California, which is part of the South Coast Air Basin (Basin) and is under the jurisdiction of the SCAQMD.

Climate/Meteorology

Air quality in the planning area is not only affected by various emission sources (e.g., mobile and industry), but also by atmospheric conditions (e.g., wind speed, wind direction, temperature, and rainfall). The nearest representative meteorological station that provides the American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) ready meteorological data is the John Wayne International Airport Meteorological Station, approximately 15 miles south of the project site. Figure 3, Project Area Wind Patterns, shows the windrose[7] from data measured at this station and the wind patterns for the project area.



Source: SCAQMD Meteorological Data for AERMOD. Website: www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/data-for-aermod (accessed April 2022).

Figure 3: Project Area Wind Patterns

[7] A windrose provides a succinct view of how wind speed and direction are typically distributed at a particular location. Presented in a circular format, the windrose shows the frequency of winds blowing from particular directions.

Toxic Air Contaminants

The public's exposure to TACs is a significant environmental health issue in the State of California. In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health. The Health and Safety Code defines a TAC as "an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health." A substance that is listed as a hazardous air pollutant pursuant to subsection (b) of Section 112 of the Federal Act (42 United States Code Section 7412) is a TAC. Under State law, the California Environmental Protection Agency, acting through CARB, is authorized to identify a substance as a TAC if it determines the substance is an air pollutant that may cause or contribute to an increase in mortality or an increase in serious illness, or which may pose a present or potential hazard to human health.

California regulates TACs primarily through Assembly Bill (AB) 1807 (Tanner Air Toxics Act), AB 2588 (Air Toxics "Hot Spot" Information and Assessment Act of 1987), and Senate Bill 25, the Children's Environmental Health Protection Act. The Tanner Air Toxics Act sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an "airborne toxics control measure" for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology to minimize emissions.

Air toxics from stationary sources are also regulated in California under AB 2588. Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the designated air quality management district or air pollution control district. High-priority facilities are required to perform an HRA and, if specific thresholds are exceeded, are required to communicate the results to the public in the form of notices and public meetings.

To date, CARB has designated nearly 200 compounds as TACs. Additionally, CARB has implemented control measures for a number of compounds that pose high risks and show potential for effective control. The majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from diesel-fueled engines (diesel particulate matter or DPM).

THRESHOLDS OF SIGNIFICANCE

Both the State and federal governments have established health-based ambient air quality standards for seven air pollutants. For other air pollutants without defined significance standards, the definition of substantial pollutant concentrations varies. For TACs, "substantial" is taken to mean that the individual health risk exceeds a threshold considered to be a prudent risk management level.

The following limits for maximum individual cancer risk (MICR) and noncancer acute and chronic Hazard Index (HI) from project emissions of TACs are considered appropriate for use in determining the health risk for projects in the Basin:

- **MICR:** MICR is the estimated probability of a maximally exposed individual (MEI) contracting cancer as a result of exposure to TACs over a period of 30 years for adults and 9 years for children in residential locations and over a period of 25 years for workers. The MICR calculations include multipathway consideration, when applicable.

  The cumulative increase in MICR that is the sum of the calculated MICR values for all TACs would be considered significant if it would result in an increased MICR greater than 10 in 1 million (1×10^{-5}) at any receptor location.

- **Chronic HI:** Chronic HI is the ratio of the estimated long-term level of exposure to a TAC for a potential MEI to its chronic reference exposure level. The chronic HI calculations include multipathway consideration, when applicable.

  The project would be considered significant if the cumulative increase in total chronic HI for any target organ system would exceed 1.0 at any receptor location.

- **Acute HI:** Acute HI is the ratio of the estimated maximum 1-hour concentration of a TAC for a potential MEI to its acute reference exposure level.

  The project would be considered significant if the cumulative increase in total acute HI for any target organ system would exceed 1.0 at any receptor location.

The SCAQMD *CEQA Air Quality Handbook*[8] states that emissions of TACs are considered significant if an HRA shows an increased risk of greater than 10 in 1 million. Based on guidance from SCAQMD in the document *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*[9], for the purposes of this analysis, the threshold of 10 in 1 million was used as the cancer risk threshold for the proposed project.

8 SCAQMD. 1993. *CEQA Air Quality Handbook* (currently under revision).

9 SCAQMD. 2003. *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*. August.

METHODOLOGY

This construction HRA evaluates the health risk to off-site receptors due to diesel fueled equipment used during the construction period. To estimate the potential cancer risk associated with construction of the proposed project from equipment exhaust (including DPM), a dispersion model was used to translate an emission rate from the source location to a concentration at the receptor location of interest (i.e., a nearby residence and worksites). Dispersion modeling varies from a simpler, more conservative screening-level analysis to a more complex and refined detailed analysis. This refined assessment was conducted using the CARB exposure methodology with the air dispersion modeling performed using the United States Environmental Protection Agency's (USEPA) AERMOD air dispersion model. The model provides a detailed estimate of exhaust concentrations based on site and source geometry, source emissions strength, distance from the source to the receptor, and meteorological data.

The California Emissions Estimator Model version 2020.4.0 (CalEEMod) computer program was used to calculate emissions from on-site construction equipment and emissions from worker and vehicle trips to the site, which was included in AERMOD. This analysis assumes that construction would begin September 2022 and end December 2023. The proposed project would require the export of up to 1,000 cubic yards of material, which was included in this analysis. This analysis also assumes the use of Tier 2 construction equipment and that the proposed project would comply with SCAQMD dust control regulations. All other construction details are not yet known; therefore, default assumptions (e.g., construction worker and truck trips and fleet activities) from CalEEMod were used.

A screening-level multipathway assessment has been conducted. This technique was chosen as recommended in the OEHHA *Air Toxic Hot Spots Program Risk Assessment Guidelines*.[10]

This HRA has been conducted using AERMOD to determine how the TACs would move through the atmosphere after release from the on-site sources; and the CARB's HARP model to translate the pollutant concentrations from AERMOD into individual health risks at the nearby sensitive receptor locations.

This HRA includes analyzing the inhalation, dermal soil, mother's milk, and homegrown produce pathways. This technique was chosen as prescribed in SCAQMD's *AB2588 and Rule 1402 Supplemental Guidelines*.[11]

The OEHHA has determined that long-term exposure to diesel exhaust particulates poses the highest cancer risk of any TAC it has evaluated. Exposure to diesel exhaust can also have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles (also known as DPM) made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs,

10 OEHHA. 2015. op cit.
11 SCAQMD. 2018. op. cit.

which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. For risk assessment procedures, the OEHHA specifies that the surrogate for whole diesel exhaust is DPM.

The conservative nature of this analysis is due primarily to the following three factors:

- The CARB-adopted diesel exhaust unit risk factor (URF) of 300 in 1 million per microgram per cubic meter is based on the upper 95th percentile of estimated risk for each of the epidemiological studies used to develop the URF. Therefore, the risk factor is already representative of the conservative risk posed by DPM.

- The risk estimates assume sensitive residence receptors would be subject to DPM for 24 hours per day, 350 days per year and worker receptors for 8 hours per day, 350 days per year. As a conservative measure, SCAQMD does not recognize indoor adjustments for residents or workers. However, typical people spend the majority of their time indoors versus remaining outdoors for 24 hours per day, 350 days per year.[12] Therefore, the actual exposure any person would experience would be less than considered in this analysis. This results in much lower actual health risk levels than presented in this analysis.

- The exposure to DPM is assumed to be constant for the given period analyzed (i.e., 30 years). However, emissions from DPM are expected to substantially decrease in the future with the implementation of standard regulatory requirements and technological advancement to reduce DPM. Therefore, the health risk levels from these future trucks would be less than presented in this analysis.

Improvements over the last 40 years to diesel fuel and diesel engines have resulted in lower emissions of some of these TACs.[13] These improvements resulted in a 75 percent reduction in particle emissions from diesel-powered trucks and other equipment in 2010 and an 85 percent reduction in 2020 compared to 2000 levels.[14] These improvements are anticipated to continue into the foreseeable future. Electric trucks are also being phased in and, once in use, would eliminate the emissions of DPM associated with truck travel.

Emission Sources

The first step of an HRA is to characterize the project-related emissions of TACs. The proposed project is estimated to use equipment as shown in Table A.

---

12 In May 1991, the CARB Research Division, in association with the University of California, Berkeley, published research findings titled *Activity Patterns of California Residents*. The findings of that study indicate that, on average, adults and adolescents in California spent almost 15 hours per day inside their homes and 6 hours in other indoor locations, for a total of 21 hours (87 percent of the day). About 2 hours per day were spent in transit, and just over 1 hour per day was spent in outdoor locations.

Source: Compiled by LSA (2022).

While the TAC emissions from gasoline-powered vehicles have a small health effect compared to DPM, this HRA includes all the traffic information described and both gasoline- and diesel-powered vehicle emissions. For the diesel exhaust emissions, it is sufficient to only consider the DPM (particulate matter less than 10 microns in diameter [PM_{10}]) portion of the exhaust; all the TACs for the gasoline exhaust emissions are contained in the reactive organic gas (ROG) emissions. Using speciation data from CARB, the emission rates of the TAC components are derived from the total ROG emissions.

Emissions from CalEEMod were used in the analysis to determine the total construction emissions of PM_{10}. Although the TAC of concern from diesel construction equipment is DPM, CalEEMod does not include emissions factors for this TAC. DPM is a component of the overall exhaust from the project-related trucks. This HRA conservatively assumes the DPM emissions to be equal to the PM_{10} emissions when actually the DPM is only a portion of the overall PM_{10} in the equipment exhaust.

CONSTRUCTION HEALTH RISK IMPACTS

The following section describes the potential impacts on sensitive and worker receptors from construction and operation of the proposed project. As identified above, the closest sensitive receptors include the multifamily residences and Fletcher Elementary School, opposite Fletcher Avenue approximately 445 feet north of the project site. The closest worker receptors include the industrial uses opposite North American Way, approximately 165 feet east of the project site.

Table B, below, identifies the results of the analysis at the MEI, which is the nearest sensitive receptor. Model snap shots of the sources are attached. Table B identifies the results of the analysis.

Table B: Health Risk from Project Construction to Off-Site Receptors

Location	Carcinogenic Inhalation Health Risk in One Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index
Worker Receptor Risk	0.1	0.005	0.000
Sensitive Receptor Risk	4.3	0.003	0.00
SCAQMD Significance Threshold	**10 in one million**	**1.0**	**1.0**
Significant?	**No**	**No**	**No**

Source: Compiled by LSA (2022).
SCAQMD = South Coast Air Quality Management District

As shown in Table B, the cancer risk at the sensitive receptor MEI would be 4.3 in one million, which would not exceed the SCAQMD cancer risk of 10 in one million., no significant health risk would occur from project construction emissions.

Table C: Health Risks from Project Operation to Off-Site Receptors

Location	Carcinogenic Inhalation Health Risk in One Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index
Worker Receptor Risk	0.5	0.002	0.000
Sensitive Receptor Risk	3.6	0.001	0.000
SCAQMD Significance Threshold	**10.0 in one million**	**1.0**	**1.0**
Significant?	**No**	**No**	**No**

Source: Compiled by LSA (2022).
SCAQMD = South Coast Air Quality Management District

As shown in Table C, the maximum cancer risk for the sensitive receptor MEI would be 3.6 in one million, less than the threshold of 10 in one million, which would not exceed the SCAQMD cancer risk threshold of 10 in one million. The worker receptor risk would be lower at 0.5 in one million, which would also not exceed the threshold. The total chronic hazard index would be 0.002 for the worker receptor MEI and 0.001 for the sensitive receptor MEI, which is below the threshold of 1.0. In addition, the total acute hazard index would be nominal (0.000), which would also not exceed the threshold of 1.0. As these results show, all health risk levels to nearby residents from operation-

related emissions of TACs would be well below the SCAQMD's HRA thresholds. No significant health risk would occur from project operation emissions.

CONCLUSION

As these results show, all health risk levels to nearby residents from construction-related emissions of TACs would be well below the SCAQMD's HRA thresholds. No significant health risk would occur from project-related emissions. The HARP modeling reports and AERMOD information are attached.

INTRODUCTION

LSA has prepared this operational health risk assessment (HRA) for the proposed 2390 North American Way Warehouse Project (project) in Orange, California.

An HRA is a process used to estimate the increased health risk levels for people living and/or working near a project that emits toxic air contaminants (TACs). An HRA combines results of studies on the health effects of various animal and human exposure to TACs with results of studies that estimate the exposure levels at different distances from the source of pollutants. The purpose of the HRA is to document the increased cancer and noncancer health risk levels from project-related emissions of TACs on existing nearby sensitive receptors, including residents and/or workers.

The City of Orange (City) recommends the preparation of an HRA in accordance with policies and procedures of the State Office of Environmental Health Hazard Assessment (OEHHA) and the South Coast Air Quality Management District (SCAQMD). This HRA evaluates all of these criteria in compliance with applicable requirements.

PROJECT LOCATION AND DESCRIPTION

The proposed project would construct two warehouses with total building areas of 50,200 square feet (sf) (Building 1) and 47,300 sf (Building 2). Each building would include a 2,000 sf office, dock doors, and associated parking. Building 1 would be located at the southern end of the property, and Building 2 would be located at the northern end of the property. Each building would span the allowable width of the property. The project is anticipated to be operational in 2023. Typical operational characteristics include employees traveling to and from the site, delivery of materials and supplies to the site, truck loading and unloading, and distribution. The project is assumed to operate 24 hours a day, 7 days a week; however, this may shift depending on the tenant, as the hours of operation are unknown.

The proposed project is located at 2390 North American Way, at the southwest corner of the West Fletcher Avenue and North American Way intersection in the city of Orange. The project site is identified by Assessor's Parcel Numbers (APNs) 374-632-08, 374-632-07, and 374-632-05. The project site is currently occupied with industrial uses on the north lot, while the southern lot is developed with an event/cultural center. The event/cultural center is closed and has been vacated. Additionally, there are two non-conforming residential homes as well as a related parking garage on the southeast corner of the northern parcel. All existing structures and improvements would be removed prior to grading operations. Figure 1 illustrates the project site location. Figure 2 depicts the proposed project's site plan.

EXISTING LAND USES IN THE PROJECT AREA

For the purposes of this analysis, sensitive receptors are areas of the population that have an increased sensitivity to air pollution or environmental contaminants. Sensitive receptor locations include residences, schools, daycare centers, hospitals, parks, and similar uses that are sensitive to air quality. Impacts on sensitive receptors are of particular concern because those receptors are the population most vulnerable to the effects of air pollution. The project site is surrounded primarily by residential, commercial, and community facility development. The areas adjacent to the project site include the following uses:

- **North:** Multifamily residences and Fletcher Elementary School, opposite Fletcher Avenue;
- **East:** Industrial uses opposite North American Way;
- **South:** Office/Light Industrial Uses opposite Freedom Avenue and single-family homes further south; and
- **West:** Industrial uses opposite the adjacent water basin.

The closest sensitive receptors include the multifamily residences and Fletcher Elementary School, opposite Fletcher Avenue approximately 445 feet north of the project site. The closest worker receptors include the industrial uses opposite North American Way, approximately 165 feet east of the project site.

BACKGROUND

This section provides a discussion of regulatory guidance from the California Air Resources Board (CARB), the OEHHA, the California Air Pollution Control Officers Association (CAPCOA), and the SCAQMD.

CALIFORNIA AIR RESOURCES BOARD HANDBOOK AND TECHNICAL ADVISORY

CARB has developed an *Air Quality and Land Use Handbook* (CARB Handbook;)[1] and a supplement, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*[2], which are intended to serve as general reference guides for evaluating and reducing air pollution impacts associated with new projects that are part of the land use decision-making process. According to the CARB Handbook, recent air pollution studies have shown an association between both respiratory and other noncancer health effects and proximity to high-traffic roadways and other land uses associated with high volume truck traffic. Other studies have shown that diesel exhaust and other cancer-causing chemicals emitted from cars and trucks are responsible for much of the overall cancer risk from airborne toxics in California. The CARB Handbook recommends that planning agencies recognize that the configuration of warehouse and distribution centers can reduce population exposure and risk. For example, locating the main entry and exit points away from sensitive land uses helps to reduce cancer risks and other health impacts.

OFFICE OF ENVIRONMENTAL HEALTH AND HAZARD ASSESSMENT GUIDELINES

The OEHHA developed the *Air Toxics Hot Spots Program Guidance Manual*[3] in conjunction with the CARB for use in implementing the Air Toxics Hot Spots Program (Health and Safety Code Section 44360). The manual describes health effect values, exposure pathway variates (e.g., breathing rates), and a tiered approach for performing HRAs based on current science and policy assessment. The intent of the guidance manual is to incorporate children's health concerns, update risk assessment practices, and provide consistent risk assessment procedures.

CALIFORNIA AIR POLLUTION CONTROL OFFICERS ASSOCIATION

In 2009, the CAPCOA published guidance[4] on assessing the health risk impacts from and to proposed land use projects, focusing on the acute, chronic, and cancer impacts of sources affected by California Environmental Quality Act (CEQA). The document recommends procedures to identify when a project should undergo further risk evaluation, procedures for conducting an HRA,

guidelines to engage the public, presentation guidelines for results from the HRA, and mitigation measures that may be appropriate for various land use projects.

SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

The SCAQMD has risk assessment guidelines, *AB 2588 and Rule 1402 Supplemental Guidelines*[5]. These guidelines incorporate the OEHHA guidance and the options to be used when using the CARB's Hotspots Analysis and Reporting Program Version 2 (HARP) program for risk assessment calculations.[6]

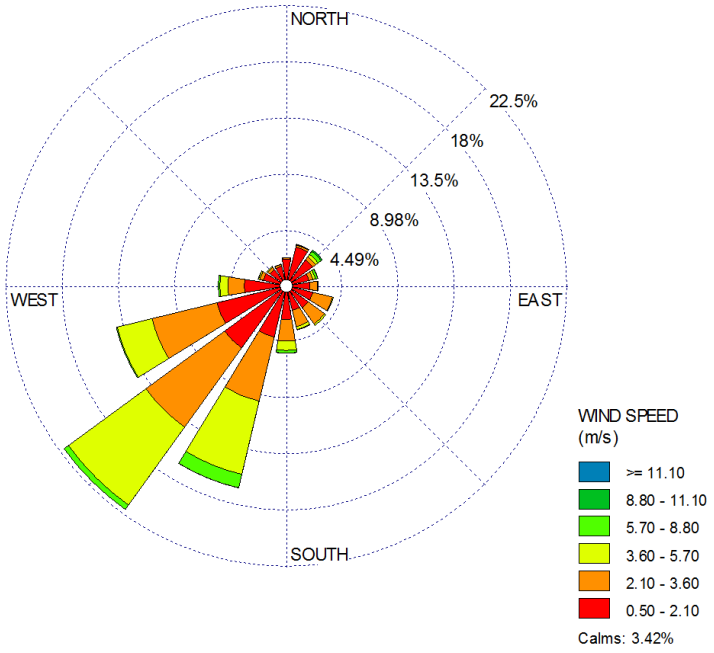
SETTING

REGIONAL AIR QUALITY

The project site is in the City of Orange, California, which is part of the South Coast Air Basin (Basin) and is under the jurisdiction of the SCAQMD.

Climate/Meteorology

Air quality in the planning area is not only affected by various emission sources (e.g., mobile and industry), but also by atmospheric conditions (e.g., wind speed, wind direction, temperature, and rainfall). The nearest representative meteorological station that provides the American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) ready meteorological data is the John Wayne International Airport Meteorological Station, approximately 15 miles south of the project site. Figure 3, Project Area Wind Patterns, shows the windrose[7] from data measured at this station and the wind patterns for the project area.



Source: SCAQMD Meteorological Data for AERMOD. Website: www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/data-for-aermod (accessed April 2022).

Figure 3: Project Area Wind Patterns

[7] A windrose provides a succinct view of how wind speed and direction are typically distributed at a particular location. Presented in a circular format, the windrose shows the frequency of winds blowing from particular directions.

Toxic Air Contaminants

The public's exposure to TACs is a significant environmental health issue in the State of California. In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health. The Health and Safety Code defines a TAC as "an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health." A substance that is listed as a hazardous air pollutant pursuant to subsection (b) of Section 112 of the Federal Act (42 United States Code Section 7412) is a TAC. Under State law, the California Environmental Protection Agency, acting through CARB, is authorized to identify a substance as a TAC if it determines the substance is an air pollutant that may cause or contribute to an increase in mortality or an increase in serious illness, or which may pose a present or potential hazard to human health.

California regulates TACs primarily through Assembly Bill (AB) 1807 (Tanner Air Toxics Act), AB 2588 (Air Toxics "Hot Spot" Information and Assessment Act of 1987), and Senate Bill 25, the Children's Environmental Health Protection Act. The Tanner Air Toxics Act sets forth a formal procedure for CARB to designate substances as TACs. Once a TAC is identified, CARB adopts an "airborne toxics control measure" for sources that emit designated TACs. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure to below that threshold. If there is no safe threshold, the measure must incorporate toxics best available control technology to minimize emissions.

Air toxics from stationary sources are also regulated in California under AB 2588. Under AB 2588, TAC emissions from individual facilities are quantified and prioritized by the designated air quality management district or air pollution control district. High-priority facilities are required to perform an HRA and, if specific thresholds are exceeded, are required to communicate the results to the public in the form of notices and public meetings.

To date, CARB has designated nearly 200 compounds as TACs. Additionally, CARB has implemented control measures for a number of compounds that pose high risks and show potential for effective control. The majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from diesel-fueled engines (diesel particulate matter or DPM).

THRESHOLDS OF SIGNIFICANCE

Both the State and federal governments have established health-based ambient air quality standards for seven air pollutants. For other air pollutants without defined significance standards, the definition of substantial pollutant concentrations varies. For TACs, "substantial" is taken to mean that the individual health risk exceeds a threshold considered to be a prudent risk management level.

The following limits for maximum individual cancer risk (MICR) and noncancer acute and chronic Hazard Index (HI) from project emissions of TACs are considered appropriate for use in determining the health risk for projects in the Basin:

- **MICR:** MICR is the estimated probability of a maximally exposed individual (MEI) contracting cancer as a result of exposure to TACs over a period of 30 years for adults and 9 years for children in residential locations and over a period of 25 years for workers. The MICR calculations include multipathway consideration, when applicable.

  The cumulative increase in MICR that is the sum of the calculated MICR values for all TACs would be considered significant if it would result in an increased MICR greater than 10 in 1 million (1×10^{-5}) at any receptor location.

- **Chronic HI:** Chronic HI is the ratio of the estimated long-term level of exposure to a TAC for a potential MEI to its chronic reference exposure level. The chronic HI calculations include multipathway consideration, when applicable.

  The project would be considered significant if the cumulative increase in total chronic HI for any target organ system would exceed 1.0 at any receptor location.

- **Acute HI:** Acute HI is the ratio of the estimated maximum 1-hour concentration of a TAC for a potential MEI to its acute reference exposure level.

  The project would be considered significant if the cumulative increase in total acute HI for any target organ system would exceed 1.0 at any receptor location.

The SCAQMD *CEQA Air Quality Handbook*[8] states that emissions of TACs are considered significant if an HRA shows an increased risk of greater than 10 in 1 million. Based on guidance from SCAQMD in the document *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*[9], for the purposes of this analysis, the threshold of 10 in 1 million was used as the cancer risk threshold for the proposed project.

8 SCAQMD. 1993. *CEQA Air Quality Handbook* (currently under revision).

9 SCAQMD. 2003. *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*. August.

METHODOLOGY

Dispersion modeling varies from a simpler, more conservative screening-level analysis to a more complex and refined detailed analysis. This refined assessment was conducted using the CARB exposure methodology with the air dispersion modeling performed using the United States Environmental Protection Agency's (USEPA) AERMOD air dispersion model. The model provides a detailed estimate of exhaust concentrations based on site and source geometry, source emissions strength, distance from the source to the receptor, and meteorological data.

For the purposes of an HRA, short-term emissions are of concern for analyzing acute health impacts, and long-term emissions are of concern for analyzing chronic and carcinogenic health impacts. A screening-level multipathway assessment has been conducted. This technique was chosen as recommended in the OEHHA *Air Toxic Hot Spots Program Risk Assessment Guidelines*.[10]

This HRA has been conducted using three models: the CARB's California Emissions Factor Model, Version 2021 (EMFAC2021) for vehicle emissions factors and percentages of fuel type within the overall vehicle fleet; AERMOD to determine how the TACs would move through the atmosphere after release from sources both on site and along the truck routes; and the CARB's HARP model to translate the pollutant concentrations from AERMOD into individual health risks at the nearby sensitive receptor locations.

This HRA includes analyzing the inhalation, dermal soil, mother's milk, and homegrown produce pathways. This technique was chosen as prescribed in SCAQMD's *AB2588 and Rule 1402 Supplemental Guidelines*.[11]

The OEHHA has determined that long-term exposure to diesel exhaust particulates poses the highest cancer risk of any TAC it has evaluated. Exposure to diesel exhaust can also have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. In studies with human volunteers, diesel exhaust particles (also known as DPM) made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. For risk assessment procedures, the OEHHA specifies that the surrogate for whole diesel exhaust is DPM.

The conservative nature of this analysis is due primarily to the following three factors:

- The CARB-adopted diesel exhaust unit risk factor (URF) of 300 in 1 million per microgram per cubic meter is based on the upper 95th percentile of estimated risk for each of the epidemiological studies used to develop the URF. Therefore, the risk factor is already representative of the conservative risk posed by DPM.

10 OEHHA. 2015. op cit.
11 SCAQMD. 2018. op. cit.

- The risk estimates assume sensitive residence receptors would be subject to DPM for 24 hours per day, 350 days per year and worker receptors for 8 hours per day, 350 days per year. As a conservative measure, SCAQMD does not recognize indoor adjustments for residents or workers. However, typical people spend the majority of their time indoors versus remaining outdoors for 24 hours per day, 350 days per year.[12] Therefore, the actual exposure any person would experience would be less than considered in this analysis. This results in much lower actual health risk levels than presented in this analysis.

- The exposure to DPM is assumed to be constant for the given period analyzed (i.e., 30 years). However, emissions from DPM are expected to substantially decrease in the future with the implementation of standard regulatory requirements and technological advancement to reduce DPM. Therefore, the health risk levels from these future trucks would be less than presented in this analysis.

Improvements over the last 40 years to diesel fuel and diesel engines have resulted in lower emissions of some of these TACs.[13] These improvements resulted in a 75 percent reduction in particle emissions from diesel-powered trucks and other equipment in 2010 and an 85 percent reduction in 2020 compared to 2000 levels.[14] These improvements are anticipated to continue into the foreseeable future. Electric trucks are also being phased in and, once in use, would eliminate the emissions of DPM associated with truck travel.

Emission Sources

The first step of an HRA is to characterize the project-related emissions of TACs. Operation of the proposed project would generate approximately 166 average daily trips, including 115 vehicle trips, 11 light duty truck trips, and 40 truck trips. It is assumed that the truck trips would travel approximately 40 miles per trip. The trucks would access the site by North American Way. The proposed project would provide 10 dock doors; as the project would contain multiple loading docks, off-site queuing of trucks is not anticipated. While the TAC emissions from gasoline-powered vehicles have a small health effect compared to DPM, this HRA includes all the traffic information described and both gasoline- and diesel-powered vehicle emissions. For the diesel exhaust emissions, it is sufficient to only consider the DPM (particulate matter less than 10 microns in diameter [PM_{10}]) portion of the exhaust; all the TACs for the gasoline exhaust emissions are contained in the reactive organic gas (ROG) emissions. Using speciation data from CARB, the emission rates of the TAC components are derived from the total ROG emissions.

---

12 In May 1991, the CARB Research Division, in association with the University of California, Berkeley, published research findings titled *Activity Patterns of California Residents*. The findings of that study indicate that, on average, adults and adolescents in California spent almost 15 hours per day inside their homes and 6 hours in other indoor locations, for a total of 21 hours (87 percent of the day). About 2 hours per day were spent in transit, and just over 1 hour per day was spent in outdoor locations.

13 United States Environmental Protection Agency (USEPA). n.d. *Learn About Impacts of Diesel Exhaust and the Diesel Emissions Reduction Act (DERA)*. Website: www.epa.gov/dera/learn-about-impacts-diesel-exhaust-and-diesel-emissions-reduction-act-dera (accessed April 2022).

14 OEHHA. 2001. *Health Effects of Diesel Exhaust*. May 21, 2001. Website: oehha.ca.gov/air/health-effects-diesel-exhaust, (accessed April 2022).

Project trucks would operate in two modes: stationary idling and moving on and off the site. The emissions from trucks while idling result in a much higher concentration of TACs at nearby sensitive receptors compared to the emissions from moving trucks. This is due to the dispersion of emissions that occurs with distance and with travel of the vehicle. For this HRA, the truck travel emissions were modeled as a series of volume sources along the on-site driveway, along North American Way going east and west of the site driveway. The analysis assumes vehicles traveling on site would maneuver slowly, averaging approximately 5–15 miles per hour (mph), and that vehicles traveling on roadways would average 5–55 mph.

EMFAC2021 was used to determine the emissions factors of idling and operating diesel trucks to determine the total emissions of PM_{10}. Although the TAC of concern from diesel trucks is DPM, EMFAC2021 does not include emissions factors for this TAC. DPM is a component of the overall exhaust from the project-related trucks. This HRA conservatively assumes the DPM emissions to be equal to the PM_{10} emissions when actually the DPM is only a portion of the overall PM_{10} in the truck exhaust. While it is expected that the truck emissions rate will continue to reduce over time, an HRA only allows for a single emission rate to represent the entire 25- or 30-year exposure period. The use of emissions factors for the earliest year the proposed project could start operations (2023) was selected for this HRA to be conservative. For instance, based on operations starting in 2023, using emissions factors for a 2028 vehicle fleet (the midpoint of the 9-year exposure period) or using emissions for a 2038 vehicle fleet (the midpoint of the 30-year exposure period) could be used; however, either of these would be less conservative.

HEALTH RISK IMPACTS

The following section describes the potential impacts on sensitive and worker receptors from operation of the proposed project. As identified above, the closest sensitive receptors include the multifamily residences and Fletcher Elementary School, opposite Fletcher Avenue approximately 445 feet north of the project site. The closest worker receptors include the industrial uses opposite North American Way, approximately 165 feet east of the project site.

The results of the health risk analysis using the methodology presented above for the carcinogenic and chronic health risks are shown in Table A. The residential risk incorporates both the risk for a child living in a nearby residence for 9 years (the standard period of time for child risk) and an adult living in a nearby residence for 30 years (considered a conservative period of time for an individual to live in any one residence).

Table A: Health Risks from Project Operation to Off-Site Receptors

Location	Carcinogenic Inhalation Health Risk in One Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index
Worker Receptor Risk	0.5	0.002	0.000
Sensitive Receptor Risk	3.6	0.001	0.000
SCAQMD Significance Threshold	**10.0 in one million**	**1.0**	**1.0**
Significant?	**No**	**No**	**No**

Source: LSA (April 2022).
SCAQMD = South Coast Air Quality Management District

As shown in Table C, the maximum cancer risk for the sensitive receptor MEI would be 3.6 in one million, less than the threshold of 10 in one million, which would not exceed the SCAQMD cancer risk threshold of 10 in one million. The worker receptor risk would be lower at 0.5 in one million, which would also not exceed the threshold. The total chronic hazard index would be 0.002 for the worker receptor MEI and 0.001 for the sensitive receptor MEI, which is below the threshold of 1.0. In addition, the total acute hazard index would be nominal (0.000), which would also not exceed the threshold of 1.0. As these results show, all health risk levels to nearby residents from operation-related emissions of TACs would be well below the SCAQMD's HRA thresholds. No significant health risk would occur from project operation emissions.

CONCLUSION

As these results show, all health risk levels to nearby residents from project-related emissions of TACs associated with operation of the project would be well below the SCAQMD's HRA thresholds. The HARP modeling reports and AERMOD information are attached.

OWNER'S CERTIFICATION

WATER QUALITY MANAGEMENT PLAN

FOR

American Way Industrial Project

This Preliminary Water Quality Management Plan (P-WQMP) for the American Way Industrial Project has been prepared for Rexford Industrial. This P-WQMP is intended to comply with the requirements of the City of Orange's Major Site Plan Review No. 1072-21 and Design Review No. 5059-21 requiring the preparation of a Water Quality Management Plan.

The undersigned, while it owns the subject property, is responsible for the implementation of the provisions of this plan and will ensure that this plan is amended as appropriate to reflect up-to-date conditions on the site consistent with the City of Orange Local Implementation Plan (LIP), and the intent of NPDES Permit and Waste Discharge Requirements for the City of Orange, County of Orange, Orange County Flood Control District and the incorporated Cities of Orange County within the Santa Ana Region.

This P-WQMP will be reviewed with the facility operator, facility supervisors, employees, tenants, maintenance and service contractors, or any other party having responsibility for implementing portions of this P-WQMP. Maintenance requirements within Section V and Appendix D will be adhered to with particular emphasis on maintaining the BMPs described within Sections IV and V. The Owner's Annual Self Certification Statement along with a BMP maintenance implementation table will be submitted by June 30th every year following project completion. At least one copy of the approved P-WQMP shall be available on the subject property in perpetuity.

Once the undersigned transfers its interest in the property, its successors-in-interest shall bear the aforementioned responsibility to implement and amend the P-WQMP. The City of Orange will be notified of the change of ownership and the new owner will submit a new certification.

II. Project Description

Planning Area (Location): 2390 North American Way is not located in a City of Orange Specific Planning Area, and therefore is governed by the City of Orange General Plan.

Project Site Area (ac): 4.02 ac

Project Disturbed Area (ac): 4.02 ac

Percent Change in Impermeable Surfaces: +16.7%

SIC Code 1541: General Contractors-Industrial Buildings and Warehouses
General contractors primarily engaged in the construction (including new work, additions, alterations, remodeling, and repair) of industrial buildings and warehouses, such as aluminum plants, automobile assembly plants, pharmaceutical manufacturing plants, and commercial warehouses.

Project Description
Proposed site improvements include the construction of drain inlets and underground facilities to capture and convey runoff into existing storm drain infrastructure within Freedom Avenue. Drainage of the industrial structures, streets, and landscape facilities will include catch basin inlets that are designed to capture storm water runoff and convey the runoff to the proposed on-site storm drain pipes. The runoff in the storm drain pipes is then transported into its designated pre-treatment device and infiltration chamber. Trash enclosures are proposed for the project site, and have been designed to minimize introduction of trash and pollutants into the proposed storm drain facilities.

Project Purpose and Activities
Project proposes to redevelop existing 4.02-acre site into two ~2.0-acre parcels with a ~50,000 square foot light industrial building on each parcel. Each proposed parcel will contain separate LID BMPs that are outlined in this WQMP. New commercial driveways, parking areas, truck bays, and landscaping will be constructed.

Potential Storm Water Pollutants
According to OC TGD Table 2.2, and the California State Water Resources Control Board, the Santa Ana River Reach 2 does not have any listed pollutants of concern.

Hydrologic Conditions of Concern
Per the Orange County Watershed Master Planning Susceptibility Analysis Santa Ana River exhibit, the Project Site is not within an area of "Potential Areas of Erosion, Habitat & Physical Structure Susceptibility". The exhibit shows that the runoff from the site is discharged onto "Earth (Stabilized)", and "Stabilized" portions of channel infrastructure downstream of the Project Site.

Susceptibility Mapping Summary

Stream Name	Bed and Banks Composition	Susceptibility to Hydromodification
City 36" RCP	RCP	No
Fletcher Channel	Concrete Lined	No
Santa Ana River	River / Concrete Lined	No
Pacific Ocean	n/a	n/a

The implementation of the hydromodification BMPs are not required onsite. The project will capture and infiltrate the calculated Design Capture Volume found in Section IV.8 of this WQMP. The downstream conveyances are fully managed and engineered conveyances that vary from concrete-lined or rip-rap bottomed to sand-bottomed at discharge point into Santa Ana River Reach 2. Santa Ana River Reach 2 is also managed and engineered, and is not susceptible to sedimentation or erosion.

Post Development Drainage Characteristics
Within the project site, proposed grading has designated the overall site hydrology into two drainage management areas. Each drainage management area will contain individual water quality and infiltration systems with separate overflow structures that convey large storm events via private, on-site storm drain facilities into an existing catch basin in the west end of Freedom Avenue. Each drainage management area's infiltration chamber has been sized according to the Design Capture Volume required in the Orange County Technical Guidance Document. Stormwater will be pretreated by a Contech CDS unit that will remove trash, debris, and neutrally buoyant particles 4.7mm and larger.

Commercial Projects
N/A

Site Ownership and any Easements

The project site is owned by Rexford Industrial. Contact information can be found below:

Name: Michael Ramirez

Title: Senior Project Manager

Company: Rexford Industrial

Address: 11620 Wilshire Blvd, Suite 1000, Los Angeles, CA 90025

Telephone Number: (310) 408-8784

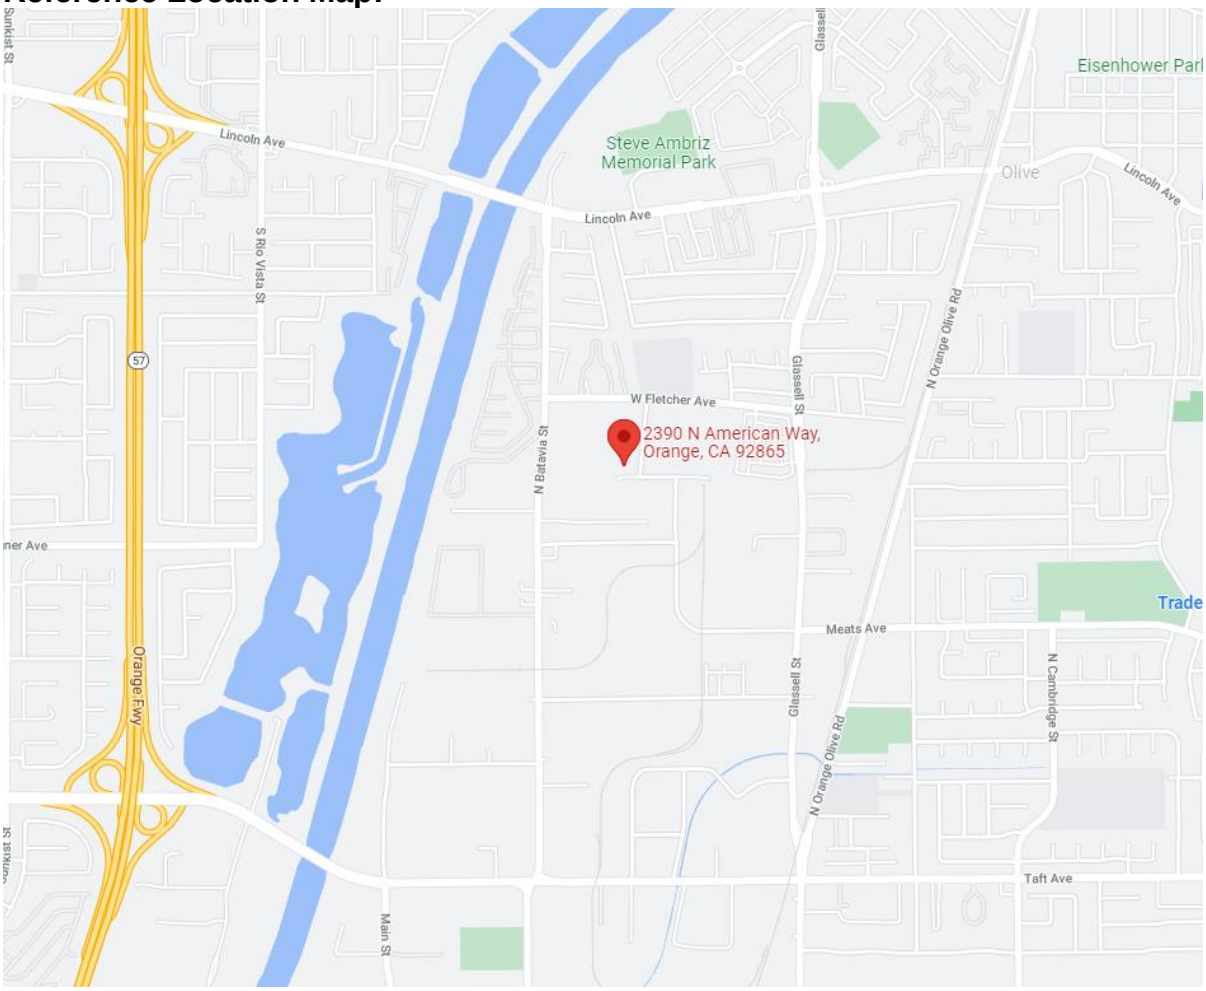
Existing on-site easements include:

1. An easement for flood control purposes in favor of the Orange County Flood Control District recorded August 28, 1951, in Book 2222, Page 187, Official Records
2. An easement for storm drain purposes in favor of the City of Orange recorded October 19, 1962, in Book 6290, Page 870, Official Records.
3. An easement for public utility purposes in favor of Southern California Edison Company recorded July 7, 1977 as Book 12280, Page 515, Official Records
4. An easement for public utility purposes in favor of Southern California Edison Company recorded April 23, 1980 as Book 13585, Page 1180, Official Records

The proposed site will contain a 6’ shared drainage easement, to be provided in the Final WQMP.

III. Site Description

Reference Location Map:



Site Address: **2390 North American Way**

Zoning: **M-1**

Predominant Soil type: **Hydrologic Soil Group A**

Pre-project percent pervious: 30.8% **Post-project percent pervious: 14.2%**

Pre-project percent impervious: 69.2% **Post-project percent impervious: 85.8%**

Site Characteristics

Drainage runoff from the existing site flows, via surface flow, southwest into an existing catch basin on Freedom Avenue. There is no existing on-site underground drainage infrastructure. The project site consists of three commercial parcels (APN's 374-632-08, 374-632-07, and 374-632-05). The southerly parcel (APN 374-632-02) is 90% impervious, and is covered by an existing building and an existing parking area. The middle parcel (APN 374-632-07) consists of mixed compacted earth, concrete pads, and small existing structures. The northerly parcel (APN 374-632-05) is covered by miscellaneous existing structures, concrete pads, and compacted earth. The site is generally flat, with slopes ranging from 0-2%. Per the Leighton Geotechnical Explorations Report (Dated 08-25-2021), groundwater was not encountered to a maximum explored depth of 50.9 feet below existing grade. California Department of Water Resources monitoring well (State Well #04S09W07N001S) approximately 0.5 miles away from the project site indicates the shallowest groundwater level at 96.6 feet below existing grade. Two test percolation/infiltration wells, LP-1 and LP-2, were conducted in accordance with the North Orange County Technical Guidance Document using the Well Permeameter Method (USBR Procedure 7300-89) found in Section VII.3.7. Each well was dug to a depth of 5-10 feet below existing grade, and found a calculated 110.5 inches per hour at boring LP-1, and 49.5 inches per hour at well LP-2. Percolation rates were converted to infiltration rates using the Darcy Flow Equation. See Section IV.8 for calculations.

Watershed Characteristics

Watershed: Lower Santa Ana River

Downstream Receiving Waters: Fletcher Channel, Reach 2-1 of Santa Ana River, Pacific Ocean

Water Quality Impairments (if applicable): N/A

Identify hydromodification susceptibility:

Susceptibility Mapping Summary

Stream Name	Bed and Banks Composition	Susceptibility to Hydromodification
City 36" RCP	RCP	No
Fletcher Channel	Concrete Lined	No
Santa Ana River	River / Concrete Lined	No
Pacific Ocean	n/a	n/a

The implementation of the hydromodification BMPs are not required onsite. The project will capture and infiltrate the calculated Design Capture Volume found in Section IV.8 of this WQMP. The downstream conveyances are fully managed and engineered conveyances that vary from concrete-lined or rip-rap bottomed to sand-bottomed at discharge point into Santa Ana River Reach 2. Santa Ana River Reach 2 is also managed and engineered, and is not susceptible to sedimentation or erosion. The project will capture and infiltrate the Design Capture Volume calculated in Section IV.8 of this report.

Identify watershed management priorities: N/A

IV. Best Management Practices

- Priority Projects must infiltrate, harvest and use, or biotreat/biofilter, the 85th percentile, 24-hour storm event (Design Capture Volume).
- A properly designed biotreatment system may only be considered if infiltration, harvest and use, and evapotranspiration (ET) cannot be feasibly implemented for the full design capture volume. In this case, infiltration, harvest and use, and ET practices must be implemented to the greatest extent feasible and biotreatment may be provided for the remaining Design Capture Volume. A diversity of controls will be provided, if feasible, to achieve the greatest feasible retention of the Design Capture Volume, then if necessary, biotreatment of the remaining Design Capture Volume.

Equivalent performance criteria have been synthesized from permit requirements with consideration of the MEP standard and analysis of local precipitation and ET patterns. The following performance criteria result in capture and retention and/or biotreatment of 80 percent of average annual stormwater runoff volume. The performance criteria for LID are stated as follows:

- LID BMPs must be design to retain, on-site, (infiltrate, harvest and use, or evapotranspire) stormwater runoff as feasible up to the Design Capture Volume, and
- Recover (i.e., draw down) the storage volume as soon as possible after a storm event (see criteria for maximizing drawdown rate in the TGD Appendix XI), and, if necessary
- Biotreat, on-site, additional runoff, as feasible, up to 80 percent average annual capture efficiency (cumulative, retention plus biotreatment), and, if necessary
- NOC Permit Area only – retain or biotreat, in a regional facility, the remaining runoff up to 80 percent average annual capture efficiency (cumulative, retention plus biotreatment, on-site plus off-site), and, if necessary
- Fulfill alternative compliance obligations for runoff volume not retained or biotreated up to 80 percent average annual capture efficiency using treatment controls or other alternative approaches as described in Section 7.II.3.

IV.1 Site Design and Drainage Characteristics

Table 1

Site Design BMPs

Technique	Included?		If no, state justification.
	Yes	No	
Minimize Directly Connected Impervious Areas (DCIAs) (C-Factor Reduction)		X	See below.
Create Reduced or "Zero Discharge" Areas (Runoff Volume Reduction)[1]	X		
Minimize Impervious Area/Maximize Permeability (C-Factor Reduction)[2]		X	See below.
Conserve Natural Areas (C-Factor Reduction)		X	See below.

1 Detention and retention areas incorporated into landscape design provide areas for retaining and detaining stormwater flows, resulting in lower runoff rates and reductions in volume due to limited infiltration and evaporation. Such Site Design BMPs may reduce the size of Treatment Control BMPs.

2 The "C Factor" is a representation of the ability of a surface to produce runoff. Surfaces that produce higher volumes of runoff are represented by higher C Factors. By incorporating more pervious, lower C Factor surfaces into a development, lower volumes of runoff will be produced. Lower volumes and rates of runoff translate directly to lowering treatment requirements.

Minimize Directly Connected Impervious Areas: Traditional industrial projects regularly propose 90% site imperviousness, which makes disconnecting impervious areas not feasible.

Create Reduced or "Zero Discharge" Areas: Landscaping adjacent to both proposed industrial structures creates areas within the project that can be considered "zero discharge". Native soil conditions are favorable to infiltrate/convey small storm events.

Minimize Impervious Area/Maximize Permeability: Proposed industrial site characteristics and activities will not maximize site permeability.

Conserve Natural Areas: Due to the site being previously developed, conservation of natural areas is not feasible.

IV.2 Source Control BMPs

IV.2.1 Routine Non-Structural BMPs

Table 2

Routine Non-Structural BMPs

BMP No.	Name	Check One		If not applicable, state brief reason.
		Included	Not Applicable	
N1	Education for Property Owners, Tenants and Occupants	X		
N2	Activity Restriction	X		
N3	Common Area Landscape Management	X		
N4	BMP Maintenance	X		
N5	Title 22 CCR Compliance		X	Proposed project will not use or contain hazardous materials.
N6	Local Water Quality Permit Compliance		X	This BMP is not applicable. The City of Orange does not issue water quality permits.
N7	Spill Contingency Plan		X	Proposed project will not contain hazardous materials, or fueling operations, and will not require a spill contingency plan.
N8	Underground Storage Tank Compliance		X	This project does not have underground tanks.
N9	Hazardous Materials Disclosure Compliance		X	Proposed project will not contain hazardous materials. No disclosure is necessary.
N10	Uniform Fire Code Implementation		X	Proposed project does not include hazardous materials (toxic and highly toxic compressed gases).
N11	Common Area Litter Control	X		
N12	Employee Training	X		
N13	Housekeeping of Loading Docks	X		
N14	Common Area Catch Basin Inspection	X		
N15	Street Sweeping Private Streets and Parking Lots	X		

N1 Education of Property Owners, Tenants and Occupants:

Practical information will be provided to the tenants by the Property Manager on general housekeeping practices for reach type of site occupancy that contribute to protection of storm water quality. Information will include, but not limited to the attachments provided in Attachment 8. The following resources can be contacted to obtain updated educational information at the County of Orange Stormwater Program website (http://www.H2OC.org) and the California Storm water Quality Association's (CASQA) BMP Handbooks ((http://www.casqa.org/resources/bmphandbooks).

N2 Activity Restrictions:

The owner(s) are to develop continuous activity restrictions that include potential impacts to stormwater quality. The following is a list of activity restrictions, but are not limited:

- Do not wash water from concrete, mortar or other construction activities to enter the storm drain system.
- No unauthorized car washing will be permitted on the premises.
- No changing of car oil or other auto repairs will be permitted on the premises.
- On-Site Cleaning of trash dumpsters with water is prohibited.
- Do not sweep grass clippings, dead leaves into catch basins or other landscaping related debris into catch basins.
- Keep trash container areas, free of liter.
- Do not perform paint cleanup activities in paved areas or allow rinse water from these activities to enter the storm drain system.
- Do not use detergents or other chemicals additives when washing concrete sidewalks or building exteriors, use potable water only when and collect wash water runoff using a vacuum truck, for proper offsite disposal.

N3 Common Area Landscape Management:

Maintenance activities for landscape areas shall be consistent with County/City and manufacturer guidelines for fertilizer and pesticide use. Maintenance includes trimming, weeding and debris removal and vegetation planting and replacement. Stockpiled materials during maintenance activities shall be placed away from drain inlets and runoff conveyance devices. Wastes shall be properly disposed of or recycled. Maintenance for common areas and landscape parking islands is scheduled by owner(s).

N4 BMP Maintence:

Responsibility for implementation, inspection and maintenance of all BMPs (structural and non-structural) shall be consistent with the BMP Inspection and Maintenance Responsibilities Matrix provided in Section V of this WQMP, with documented records of inspections and maintenance activities completed. Cleaning of all structural BMP Facilities is scheduled by future owner(s).

N11 Common Area Litter Control:

Litter control onsite will include the use of litter patrols, violation reporting and clean up during landscaping maintenance activities and as needed to ensure good housekeeping of the project's common areas.

N12 Employee Training:

An Employee Training/Education program shall be provided annually to help educate employees about storm water quality management and practices that help prevent storm water pollution. Documentation of such training/education program implementation shall be kept by the owner for a minimum of ten years.

N13 Housekeeping of Loading Docks:

The project site will have lowered truck docks. The truck docks and inlets shall be inspected on a weekly basis to help ensure that any trash and debris are collected prior to being washed into the underground storm drain system. Documentation of such inspection/maintenance shall be kept by the owner in perpetuity. The truck dock inlets hydrocarbon filters shall be serviced no less than three times a year, and once prior to the start of rainy season (October 1st).

N14 Common Area Catch Basin Inspection:

The on-site catch basins shall be inspected on a quarterly basis. Inspection of the on-site catch basins shall consist of visual inspection of any sediment, trash, or debris collected in the bottom of the catch basin. Any sediment, trash, or debris shall be removed from the catch basins and disposed of in a legal manner. Documentation of such inspection/maintenance shall be kept by the owner in perpetuity.

N15 Street Sweeping Private Streets and Parking Lots:

The on-site parking lots, drive aisles, and loading dock areas shall be swept by a sweeper truck on a monthly basis. Documentation of such sweeping shall be kept by the owner in perpetuity. Frequency of sweeping shall be adjusted as needed to maintain a clean site.

IV.2.2 Routine Structural BMPs

Table 3

Routine Structural BMPs

Name	Check One		If not applicable, state brief reason
	Included	Not Applicable	
Provide storm drain system stenciling and signage- "No Dumping – Drains to Ocean"	X		
Design and construct outdoor material storage areas to reduce pollution introduction		X	No outdoor material storage.
Design and construct trash and waste storage areas to reduce pollution introduction	X		
Use efficient irrigation systems & landscape design	X		
Protect slopes and channels and provide energy dissipation		X	Project does not include slopes or channels.
Incorporate requirements applicable to individual project features			
a. Dock areas	X		
b. Maintenance bays		X	Project does not include maintenance bays.
c. Vehicle or community wash areas		X	Project does not include vehicle wash areas.
d. Outdoor processing areas		X	Project does not include outdoor equipment.
e. Equipment wash areas		X	Project does not include outdoor equipment.
f. Fueling areas		X	Project does not include fueling areas.
g. Hillside landscaping		X	Project does not include hillside landscaping.
h. Wash water control for food preparation areas		X	Project does not include food preparation areas.

Provide Storm Drain Stenciling:

The on-site storm drain catch basins shall be stenciled with the phrase "Do Not Dump – Drains to Ocean" or other approved language. The signage shall be inspected on an annual basis. Missing or faded signage shall be replaced. Documentation of such inspection/maintenance shall be kept by the owner in perpetuity.

Design and Construct Trash and Waste Storage Areas to Reduce Pollution:

Trash storage areas will be designed to have adjacent areas drain away from the trash storage areas. The trash storage areas shall be inspected and maintained on a weekly basis. Collection of trash from the trash storage areas shall occur on a regular basis to ensure that the trash receptacles are not overflowing. Documentation of such inspection/maintenance and trash collection shall be kept by the owner in perpetuity.

Loading Dock Areas:

Truck bays are depressed 4.0' from the finish floor elevation of the building, and shall contain inlets to prevent ponding of storm water. All loading dock inlets shall be FloGard storm drain inlets with absorbent pouches to limit contaminants/pollutants from entering the hydrodynamic separator, infiltration chamber, and groundwater. Alongside the FloGard inlets, loading dock areas shall be kept in accordance with N13 (Housekeeping of Loading Docks). Maintenance of FloGard inlets with absorbent pouches and Contech CDS hydrodynamic separator shall be in accordance with Table 8: Maintenance Frequency Matrix found in Section V of this WQMP. Documentation of such inspection/maintenance activities shall be kept by the owner in perpetuity.

IV.3 Low Impact Development BMP Selection

Underground infiltration chambers with hydrodynamic separators as pretreatment were selected as the project LID BMPs due to on-site groundwater and soils conditions that are generally favorable for infiltration.

IV.3.1 Hydrologic Source Controls

No Hydrologic Source Controls were selected for this project. The proposed infiltration BMPs are able to address the calculated Design Capture Volume.

Storm water runoff is proposed to be conveyed to on-site parking lot where it's captured by catch basins, and pre-treated by a Contech CDS hydrodynamic separator. Flow is then transported to underground storage chambers via proposed storm drain infrastructure. Retention depth provided by the underground infiltration chambers equals the depth that would drawdown down in 48 hours. The proposed infiltration chambers are designed to carry a maximum storage depth of 5.0' (not including the underlying rock layer) before high-water flows exit the system via a high point invert in proposed storm drain manhole (i.e. the invert of Infiltration Chamber 'A' is 191.45' and the tipping point for high-water flows existing the manhole is 196.45'). After exiting the high point in the storm drain manhole, runoff will overflow into private, on-site storm drain facilities that convey large storm events into off-site drainage infrastructure.

According to Table 2.1 of the OC TGD, anticipated and potential pollutants from the proposed industrial site include: suspended solid/sediments, nutrients, pesticides, oil & grease, toxic organic compounds, and trash & debris. The proposed Contech CDS

units for pre-treatment prior to infiltration will remove hydrocarbons (oil & grease), trash, and debris. According to Table 4.4 of the OC TGD, the proposed underground infiltration chambers will remove suspended solids / sediment, particulate-bound pollutants, nitrogen compounds, phosphorus, heavy metals, microbial / viral pathogens, oils, grease, and toxic organic compounds. All potential pollutants of concern are addressed by the proposed on-site BMPs.

Worksheet I: Summary of Groundwater-related Feasibility Criteria

1	Is project large or small? (as defined by Table VIII.2) circle one	(Large)		Small
2	What is the tributary area to the BMP?	A	4.02	acres
3	What type of BMP is proposed?	Two infiltration chambers		
4	What is the infiltrating surface area of the proposed BMP?	A_{BMP}	2,900	sq-ft
5	What land use activities are present in the tributary area (list all) -Light Industrial			
6	What land use-based risk category is applicable?	L	(M)	H
7	If M or H, what pretreatment and source isolation BMPs have been considered and are proposed (describe all): All storm water runoff will be pre-treated by a Contech CDS hydrodynamic separator before going into each infiltration chamber.			
8	What minimum separation to mounded seasonally high groundwater applies to the proposed BMP? See Section VIII.2 (circle one)	5 ft	(10 ft)	
9	Provide rationale for selection of applicable minimum separation to seasonally high mounded groundwater: Per the geotechnical report by Leighton (dated 08-25-2021) groundwater is at a maximum height of 50 feet below grade. The proposed infiltration chambers will be at a maximum depth of 10 feet below grade, which is greater than 15 feet.			
10	What is separation from the infiltrating surface to seasonally high groundwater?	SHGWT	N/A	ft
11	What is separation from the infiltrating surface to mounded seasonally high groundwater?	Mounded SHGWT	N/A	ft
12	Describe assumptions and methods used for mounding analysis: N/A			
13	Is the site within a plume protection boundary (See Figure	Y	(N)	N/A

TECHNICAL GUIDANCE DOCUMENT APPENDICES

Worksheet I: Summary of Groundwater-related Feasibility Criteria

	VIII.2)?	
14	Is the site within a selenium source area or other natural plume area (See Figure VIII.2)?	Y (N) N/A
15	Is the site within 250 feet of a contaminated site?	Y (N) N/A
16	If site-specific study has been prepared, provide citation and briefly summarize relevant findings: N/A	
17	Is the site within 100 feet of a water supply well, spring, septic system?	Y (N) N/A
18	Is infiltration feasible on the site relative to groundwater-related criteria?	(Y) N

Provide rationale for feasibility determination:

Per the Leighton geotechnical report (dated 08-25-2021), two infiltration testing wells (LP-1 & LP-2) were dug according to Orange County standards. Well LP-1 has a measured infiltration rate of 110.5 inches per hour, and well LP-2 had a measured infiltration rate of 49.5 inches per hour. The project site containing high infiltration rates and sharing a property line immediately west of a county recharge basin (Fletcher Basin) shows that infiltration is feasible.

Note: if a single criterion or group of criteria would render infiltration infeasible, it is not necessary to evaluate every question in this worksheet.

IV.3.3 Evapotranspiration, Rainwater Harvesting BMPs

Table 6

Evapotranspiration, Rainwater Harvesting BMP

Name	Check If Used
All HSCs; *See Section IV.3.1*	☐
Surface-based infiltration BMPs	☐
Biotreatment BMPs	☐
Above-ground cisterns and basins	☐
Underground detention	☐
Other:	☐
Other:	☐
Other:	☐

The proposed infiltration BMPs with pre-treatment are able to address the full Design Capture Volume from the project site, and therefore no additional LID BMPs are required.

IV.3.4 Biotreatment BMPs

Table 7
Biotreatment BMPs

Bioretention with underdrains	☐
Storm water planter boxes with underdrains	☐
Rain gardens with underdrains	☐
Constructed wetlands	☐
Vegetated swales	☐
Vegetated filter strips	☐

Wet extended detention basin	☐
Dry extended detention basins	☐
Other:	☐
Other:	☐

The proposed infiltration BMPs with pre-treatment are able to address the full Design Capture Volume from the project site, and therefore no additional LID BMPs are required.

IV.3.5 Hydromodification Control BMPs

The project site is hydromodification exempt, therefore additional hydromodification BMPs are not required.

IV.3.6 Regional/Sub-Regional LID BMPs

N/A

IV.3.7 Treatment Control BMPs

Hydrodynamic separators and filtered inlets were selected as the pre-treatment BMP prior to stormwater entering the infiltration BMPs. BMP 'HS-A' and 'HS-B' are Contech CDS units that are capable of capturing 100% of particulate material, including trash and debris, greater than the screen aperture size. Medium to coarse sediments 4.7mm and larger that are neutrally buoyant will be suspended in the system, without blinding the screen. FloGard inlets with absorbent pouches in the truck bays will effectively act as "pre-treatment" for the CDS units to prevent excess hydrocarbons, total suspended solids, and phosphorus from entering the hydrodynamic separator and infiltration chamber. Any further oil and hydrocarbons can be effectively captured when the CDS unit is equipped with an oil baffle.

IV. 4 Water Quality Credits

N/A

IV.5 Alternative Compliance Plan

N/A

IV.6 Vector Control

According to the Orange County Technical Guidance Document, all BMPs within the project site must drawdown within 48 hours. Both Infiltration Chamber 'A' and Infiltration Chamber 'B' have drawdown depths well under the maximum (Dmax) to drawdown in 48 hours. See section IV.8, DCV calculation worksheets for exact drawdown calculations. Any standing water within proposed Contech CDS units must be removed according to the Operation & Maintenance Plan found in Section 5 of this WQMP.

IV.7 Drainage Management Area (DMA)

The project has been divided into two Drainage Management Areas (DMAs) to be utilized for defining drainage areas and sizing LID and other treatment control BMPs. DMAs have been delineated based on the proposed site grading patterns. Both DMA 'A' and 'B' collect runoff from mixed surface types (asphalt, concrete, roofs, landscape). The design capture volumes (DCV) calculations are found in the worksheets below. These have been derived utilizing North Orange County Technical Guidance Document. Locations of DMAs and BMPs are identified on the BMP Exhibit.

DMA Number	BMPs	Area Treated
A	Infiltration Chamber 'A' & Hydrodynamic Separator 'HS-A'	1.98 acres
B	Infiltration Chamber 'B' & Hydrodynamic Separator 'HS-B'	2.04 acres
Total Area		4.02 acres

Total Project Area = 4.02 acres

Infiltration systems have been sized to capture all landscaping around the two buildings, but some adjacent landscaping areas will convey/contain runoff via swales and natural infiltration. Large storm events will overflow into adjacent street.

IV.8 Calculations

DCV Calculation
American Way Industrial - DMA 'A'

Worksheet B: Simple Design Capture Volume Sizing Method*

Step 1: Determine the design capture storm depth used for calculating volume			
1. Enter design capture storm depth from Figure III.1, d (inches)	d=	0.85	inches
2. Enter the effect of provided HSCs d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0.00	inches
3. Calculate the remainder of the design capture storm depth, $d_{remainder}$ (inches) (Line 1 - Line 2)	$d_{remainder}$	0.85	inches
Step 2: Calculate the DCV			
1. Enter project area to BMP (s), A (acres)	A=	1.98	acres
2. Enter Project Imperviousness, imp (unitless)	imp=	0.87	
3. Calculate runoff coefficient, C=(0.75 x imp) + 0.15	C=	0.80	
4. Calculate runoff volume, V_{design} = (C x $d_{remainder}$ x A x 43560 x (1/12))	V_{design} =	**4,903**	cu-ft
Step 3: Design BMPs to ensure full retention of the DCV			
Step 3a: Determine design infiltration rate			
1. Enter measures infiltration rate, $K_{observed}$ [1] (in/hr) (Appendix VII)	$K_{observed}$ =	49.50	in/hr
2. Enter combined safety factor from Worksheet H, S_{total} (unitless)	S_{total}=	2.63	See Worksheet
3. Calculate design infiltration rate, K_{design} = $K_{observed}$ / S_{total}	K_{design} =	**18.86**	in/hr
Step 3b: Determine minimum BMP footprint			
4. Enter drawdown time, T (max 48 hours)	T=	48	hours
5. Calculate max retention depth that can be drawn down within the drawdown time (feet), D_{max} = K_{design} x T x (1/12)	D_{max} =	75.43	feet
6. Calculate minimum area required for BMP (sq-ft), A_{min} = V_{design} / d_{max}	A_{min} =	**65.00**	sq-ft

*Per OC TGD, Section III.3, approved methods for calculating the LID Design Capture Volume.

Infiltration Safety Factor Determination
American Way Industrial - DMA 'A'

Factor Category		Factor Description	Weight (w)	Value (v)	Product (p=w*v)	Comment
A	Suitability Assessment	Assessment Methods	0.25	2	0.5	Direct measurement of 1 20 percent of infiltration area with localized infiltration measurement methods (e.g., infiltrometer)
		OC TGD Soil Number (measured infiltration rate)	0.25	1	0.25	6 or 7 (f = 0.92 or higher)
		Site Soil Variability	0.25	2	0.5	Soil borings/test pits indicate moderately homogeneous soils
		Depth to Groundwater /Impervious Layer	0.25	2	0.5	10-30 ft below facility bottom
	Suitability Assessment Safety Factor $S_A=\Sigma p$				**1.75**	
B	Design	Tributary Area Size	0.25	1	0.25	2 acres or less.
		Level of pretreatment /expected influent sediments loads	0.25	1	0.25	Excellent pre- treatment with BMPs that mitigate fine sediments such as bioretention or media filtration OR sedimentation or facility only treats runoff from relatively clean surfaces, such as rooftops.
		Redundancy of treatment	0.25	3	0.75	No redundancy in BMP treatment train.
		Compaction during construciton	0.25	1	0.25	Heavy equipment actively prohibited from infiltration areas during construction and low probability of unintended/ indirect compaction.
	Design Safety Factor $SB=\Sigma p$				1.50	
Combined Safety Factor = S_A x S_B					**2.63**	

DCV Calculation
American Way Industrial - DMA 'B'

See OC Worksheet B: Simple Design Capture Volume Sizing Method*

Step 1: Determine the design capture storm depth used for calculating volume			
1. Enter design capture storm depth from Figure III.1, d (inches)	d=	0.85	inches
2. Enter the effect of provided HSCs d_{HSC} (inches) (Worksheet A)	d_{HSC}=	0.00	inches
3. Calculate the remainder of the design capture storm depth, $d_{remainder}$ (inches) (Line 1 - Line 2)	$d_{remainder}$	0.85	inches
Step 2: Calculate the DCV			
1. Enter project area to BMP (s), A (acres)	A=	2.04	acres
2. Enter Project Imperviousness, imp (unitless)	imp=	0.87	
3. Calculate runoff coefficient, C=(0.75 x imp) + 0.15	C=	0.80	
4. Calculate runoff volume, V_{design} = (C x $d_{remainder}$ *x A x 43560 x (1/12)*)	V_{design} =	**5,051**	cu-ft
Step 3: Design BMPs to ensure full retention of the DCV			
Step 3a: Determine design infiltration rate			
1. Enter measures infiltration rate, $K_{observed}$ [1] (in/hr) (Appendix VII)	$K_{observed}$ =	49.50	in/hr
2. Enter combined safety factor from Worksheet H, S_{total} (unitless)	S_{total}=	2.63	See Worksheet
3. Calculate design infiltration rate, K_{design} = $K_{observed}$ / S_{total}	K_{design} =	**18.86**	in/hr
Step 3b: Determine minimum BMP footprint			
4. Enter drawdown time, T (max 48 hours)	T=	48	hours
5. Calculate max retention depth that can be drawn down within the drawdown time (feet), D_{max} = K_{design} x *T x (1/12)*	D_{max} =	75.43	feet
6. Calculate minimum area required for BMP (sq-ft), A_{min} = V_{design} / d_{max}	A_{min} =	**66.97**	sq-ft

*Per OC TGD, Section III.3, approved methods for calculating the LID Design Capture Volume.

V. Implementation, Maintenance and Inspection Responsibility for BMPs (O&M Plan)

Responsible Party Information

Name: Michael Ramirez

Title: Senior Project Manager

Company: Rexford Industrial

Phone Number: (310) 408-8784

Table 8 – Frequency Inspection Matrix

BMP	Responsible Party	*Maintenance Activity	*Inspection/Maintenance Frequency
Source Control BMPs (Structural and Non-structural)			
N1 Education of Property Owners, Tenants, and Occupants	Owner	Educational materials will be provided to the tenants. Owner shall distribute appropriate materials to owners and/or occupants via language, mailings, website, or meeting.	Annually
N2 Activity Restrictions	Owner	Conditions, covenants, and restrictions based on Section IV.2.1 of this report must be prepared by the developer or building operator through terms and conditions to protect surface water quality.	On-going
N3 Common Area landscape Management	Owner	On-going landscape maintenance requirements that are consistent with the County/City.	Bi-Monthly
N4 BMP Maintenance	Owner	Scheduled by the owner for all cleaning (structural and non-structural) BMP facilities. Inspection and maintenance of BMP's implemented at the project site shall be performed bi-annually, prior to October 1st. Records of inspections and BMP maintenance shall be maintained by the owner and documented in the final WQMP, and shall be submitted annually with verification.	Once a month to clean debris and silt in the bottom of drainage facilities. Intensified around October 1st of each year prior to the "first flush" storm.
N11 Common Area Litter Control	Owner	Litter patrol, violation inspections, reporting, and other litter control activities shall be in conjunction with maintenance activities to ensure good housekeeping of the project's common areas. Litter collection and removal shall be performed on a weekly basis.	On-going.
N12 Employee Training	Owner	Developer prepares manuals for initial purchasers/leasers of the site. All employees shall be trained upon hire and annually.	On-going
N13 Housekeeping of Loading Docks	Owner	Loading docks shall be inspected on a weekly basis. All trash and debris shall be removed and disposed of in a legal manner. FloGard inlets shall be serviced at minimum three times a year, and once prior to the start of rainy season (October 1st).	Weekly/Three times a year minimum, and once prior to the start of rainy season (October 1st).

N14 Common Area Catch Basin Inspection	Owner	On-site catch basins and other drainage facilities shall be inspected at least once per year, prior to the start of the rainy season (October 1st). Inlets and catch basins shall be cleaned after rain events, and when debris is present.	Once a month to clean debris and silt in the bottom of drainage facilities. Intensified around October 1st of each year prior to the "first flush" storm.
N15 Street Sweeping Private Streets and Parking Lots	Owner	The project's private streets shall be swept, at minimum, prior to the start of traditional rainy season and as needed.	Monthly or as needed
S1 Provide Storm Drain Stenciling and Signage	Owner	Storm drains shall be inspected for legibility, at a minimum, once prior to the storm season, no later than October 1st each year. Those determined to be illegible will be re-stenciled as soon as possible. Storm drain should be stenciled every other year.	Inspect annually. Re-stencil when illegible.
S3 Design Trash Enclosures to Reduce Pollutant Introduction	Owner	Sweep trash area at least once per week and before October 1st each year. Maintain area clean of trash and debris at all times.	Weekly
S4 Loading Dock Areas	Owner	Inspect loading dock filters at least once per month and before October 1st each year. Maintain loading docks clean of trash and debris at all times.	Monthly
Low Impact Development and Treatment BMPs			
Underground Infiltration Chambers 'A' & 'B'	Owner	Sediment and trash are evacuated through an access/inspection manhole. A record of each inspection is to be maintained for the life of the system.	Inspection of the chambers will be bi-annually the first year of service, and at a minimum of annually prior to October 1st and following rain events thereafter. Cleaning shall occur annually or more often as needed.
Contech CDS Units 'HS-A' & 'HS-B'	Owner	Maintenance includes inspecting the system at minimum of once every six months. A standard vacuum truck is applied for the removal of trash, debris, and hydrocarbon filter.	Inspection of the units will be at a minimum bi-annually prior to October 1st and following rain events thereafter. Cleaning shall occur at inspection or more often as needed.

*Attach in appendix additional inspection, maintenance, and operations information if required.

Regulatory Permits

N/A

Funding

Rexford Property Management shall fund and maintain all proposed BMPs. Means and methods will be disclosed in the Final WQMP.

OWNER SELF CERTIFICATION STATEMENT

As the owner representative of the American Way Industrial Project for which a Water Quality Management Plan (WQMP) was approved by the City, I hereby certify under penalty of law that all Best Management Practices contained within the approved Project WQMP have been maintained and inspected in accordance with the schedule and frequency outlined in the approved WQMP Maintenance Table.

The maintenance activities and inspections conducted are shown in the attached table and have been performed by qualified and knowledgeable individuals. Structural Treatment BMPs have been inspected and certified by a licensed professional engineer.

To the best of my knowledge, the information submitted is true and accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and citations for violating water quality regulations.

Contech CDS Units 'HS-A' & 'HS-B'	Maintenance includes inspecting the system at minimum of once every six months. A standard vacuum truck is applied for the removal of trash, debris, and hydrocarbon filter.		

* This sheet is to be submitted annually with the Owner Self Certification Statement.
** Structural Treatment BMPs should be certified by a Licensed Professional Engineer.

VI. Location Map, Site Plan, and BMP Details

Include a location map that identifies project location and proximity to nearby water bodies. In an 11X17 sheet Identify land use, cover, feasibility constraints, structures, buildings, number of units, landscape areas, storm drain inlets, storm drain facilities, drainage flow direction, structural and treatment BMP locations, dumpsters, trash enclosures, wash areas, etc.

Delineate drainage management areas showing limits (acreage) of each drainage area for all structural, treatment and Low Impact Development BMPs used and provide BMP details on plan or in Appendix C.

For information on the proposed structures, landscape areas, and storm drain facilities, see BMP Exhibit in Appendix F. For existing and proposed hydrologic site conditions see hydrology maps with supporting AES calculations provided in Appendix. For BMP details, see Appendix C.

VII. Educational Materials

Refer to the City's website www.cityoforange.org or the Orange County Stormwater Program (H2OC.org) for a library of materials available. Attach *only* the educational materials specifically applicable to the project.

Site Design & Landscape Planning SD-10

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- ☑ Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Each project site possesses unique topographic, hydrologic, and vegetative features, some of which are more suitable for development than others. Integrating and incorporating appropriate landscape planning methodologies into the project design is the most effective action that can be done to minimize surface and groundwater contamination from stormwater.

Approach

Landscape planning should couple consideration of land suitability for urban uses with consideration of community goals and projected growth. Project plan designs should conserve natural areas to the extent possible, maximize natural water storage and infiltration opportunities, and protect slopes and channels.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment.

Design Considerations

Design requirements for site design and landscapes planning should conform to applicable standards and specifications of agencies with jurisdiction and be consistent with applicable General Plan and Local Area Plan policies.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

Designing New Installations

Begin the development of a plan for the landscape unit with attention to the following general principles:

- Formulate the plan on the basis of clearly articulated community goals. Carefully identify conflicts and choices between retaining and protecting desired resources and community growth.
- Map and assess land suitability for urban uses. Include the following landscape features in the assessment: wooded land, open unwooded land, steep slopes, erosion-prone soils, foundation suitability, soil suitability for waste disposal, aquifers, aquifer recharge areas, wetlands, floodplains, surface waters, agricultural lands, and various categories of urban land use. When appropriate, the assessment can highlight outstanding local or regional resources that the community determines should be protected (e.g., a scenic area, recreational area, threatened species habitat, farmland, fish run). Mapping and assessment should recognize not only these resources but also additional areas needed for their sustenance.

Project plan designs should conserve natural areas to the extent possible, maximize natural water storage and infiltration opportunities, and protect slopes and channels.

Conserve Natural Areas during Landscape Planning

If applicable, the following items are required and must be implemented in the site layout during the subdivision design and approval process, consistent with applicable General Plan and Local Area Plan policies:

- Cluster development on least-sensitive portions of a site while leaving the remaining land in a natural undisturbed condition.
- Limit clearing and grading of native vegetation at a site to the minimum amount needed to build lots, allow access, and provide fire protection.
- Maximize trees and other vegetation at each site by planting additional vegetation, clustering tree areas, and promoting the use of native and/or drought tolerant plants.
- Promote natural vegetation by using parking lot islands and other landscaped areas.
- Preserve riparian areas and wetlands.

Maximize Natural Water Storage and Infiltration Opportunities Within the Landscape Unit

- Promote the conservation of forest cover. Building on land that is already deforested affects basin hydrology to a lesser extent than converting forested land. Loss of forest cover reduces interception storage, detention in the organic forest floor layer, and water losses by evapotranspiration, resulting in large peak runoff increases and either their negative effects or the expense of countering them with structural solutions.
- Maintain natural storage reservoirs and drainage corridors, including depressions, areas of permeable soils, swales, and intermittent streams. Develop and implement policies and

regulations to discourage the clearing, filling, and channelization of these features. Utilize them in drainage networks in preference to pipes, culverts, and engineered ditches.

- Evaluating infiltration opportunities by referring to the stormwater management manual for the jurisdiction and pay particular attention to the selection criteria for avoiding groundwater contamination, poor soils, and hydrogeological conditions that cause these facilities to fail. If necessary, locate developments with large amounts of impervious surfaces or a potential to produce relatively contaminated runoff away from groundwater recharge areas.

Protection of Slopes and Channels during Landscape Design

- Convey runoff safely from the tops of slopes.
- Avoid disturbing steep or unstable slopes.
- Avoid disturbing natural channels.
- Stabilize disturbed slopes as quickly as possible.
- Vegetate slopes with native or drought tolerant vegetation.
- Control and treat flows in landscaping and/or other controls prior to reaching existing natural drainage systems.
- Stabilize temporary and permanent channel crossings as quickly as possible, and ensure that increases in run-off velocity and frequency caused by the project do not erode the channel.
- Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion. Energy dissipaters shall be installed in such a way as to minimize impacts to receiving waters.
- Line on-site conveyance channels where appropriate, to reduce erosion caused by increased flow velocity due to increases in tributary impervious area. The first choice for linings should be grass or some other vegetative surface, since these materials not only reduce runoff velocities, but also provide water quality benefits from filtration and infiltration. If velocities in the channel are high enough to erode grass or other vegetative linings, riprap, concrete, soil cement, or geo-grid stabilization are other alternatives.
- Consider other design principles that are comparable and equally effective.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define “redevelopment” in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of “ redevelopment” must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under “designing new installations” above should be followed.

Redevelopment may present significant opportunity to add features which had not previously been implemented. Examples include incorporation of depressions, areas of permeable soils, and swales in newly redeveloped areas. While some site constraints may exist due to the status of already existing infrastructure, opportunities should not be missed to maximize infiltration, slow runoff, reduce impervious areas, disconnect directly connected impervious areas.

Roof Runoff Controls SD-11

Rain Garden

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- ☑ Contain Pollutants
- Collect and Convey

Description

Various roof runoff controls are available to address stormwater that drains off rooftops. The objective is to reduce the total volume and rate of runoff from individual lots, and retain the pollutants on site that may be picked up from roofing materials and atmospheric deposition. Roof runoff controls consist of directing the roof runoff away from paved areas and mitigating flow to the storm drain system through one of several general approaches: cisterns or rain barrels; dry wells or infiltration trenches; pop-up emitters, and foundation planting. The first three approaches require the roof runoff to be contained in a gutter and downspout system. Foundation planting provides a vegetated strip under the drip line of the roof.

Approach

Design of individual lots for single-family homes as well as lots for higher density residential and commercial structures should consider site design provisions for containing and infiltrating roof runoff or directing roof runoff to vegetative swales or buffer areas. Retained water can be reused for watering gardens, lawns, and trees. Benefits to the environment include reduced demand for potable water used for irrigation, improved stormwater quality, increased groundwater recharge, decreased runoff volume and peak flows, and decreased flooding potential.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment.

Design Considerations

Designing New Installations

Cisterns or Rain Barrels

One method of addressing roof runoff is to direct roof downspouts to cisterns or rain barrels. A cistern is an above ground storage vessel with either a manually operated valve or a permanently open outlet. Roof runoff is temporarily stored and then released for irrigation or infiltration between storms. The number of rain

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

barrels needed is a function of the rooftop area. Some low impact developers recommend that every house have at least 2 rain barrels, with a minimum storage capacity of 1000 liters. Roof barrels serve several purposes including mitigating the first flush from the roof which has a high volume, amount of contaminants, and thermal load. Several types of rain barrels are commercially available. Consideration must be given to selecting rain barrels that are vector proof and childproof. In addition, some barrels are designed with a bypass valve that filters out grit and other contaminants and routes overflow to a soak-away pit or rain garden.

If the cistern has an operable valve, the valve can be closed to store stormwater for irrigation or infiltration between storms. This system requires continual monitoring by the resident or grounds crews, but provides greater flexibility in water storage and metering. If a cistern is provided with an operable valve and water is stored inside for long periods, the cistern must be covered to prevent mosquitoes from breeding.

A cistern system with a permanently open outlet can also provide for metering stormwater runoff. If the cistern outlet is significantly smaller than the size of the downspout inlet (say ¼ to ½ inch diameter), runoff will build up inside the cistern during storms, and will empty out slowly after peak intensities subside. This is a feasible way to mitigate the peak flow increases caused by rooftop impervious land coverage, especially for the frequent, small storms.

Dry wells and Infiltration Trenches

Roof downspouts can be directed to dry wells or infiltration trenches. A dry well is constructed by excavating a hole in the ground and filling it with an open graded aggregate, and allowing the water to fill the dry well and infiltrate after the storm event. An underground connection from the downspout conveys water into the dry well, allowing it to be stored in the voids. To minimize sedimentation from lateral soil movement, the sides and top of the stone storage matrix can be wrapped in a permeable filter fabric, though the bottom may remain open. A perforated observation pipe can be inserted vertically into the dry well to allow for inspection and maintenance.

In practice, dry wells receiving runoff from single roof downspouts have been successful over long periods because they contain very little sediment. They must be sized according to the amount of rooftop runoff received, but are typically 4 to 5 feet square, and 2 to 3 feet deep, with a minimum of 1-foot soil cover over the top (maximum depth of 10 feet).

To protect the foundation, dry wells must be set away from the building at least 10 feet. They must be installed in solids that accommodate infiltration. In poorly drained soils, dry wells have very limited feasibility.

Infiltration trenches function in a similar manner and would be particularly effective for larger roof areas. An infiltration trench is a long, narrow, rock-filled trench with no outlet that receives stormwater runoff. These are described under Treatment Controls.

Pop-up Drainage Emitter

Roof downspouts can be directed to an underground pipe that daylights some distance from the building foundation, releasing the roof runoff through a pop-up emitter. Similar to a pop-up irrigation head, the emitter only opens when there is flow from the roof. The emitter remains flush to the ground during dry periods, for ease of lawn or landscape maintenance.

Foundation Planting

Landscape planting can be provided around the base to allow increased opportunities for stormwater infiltration and protect the soil from erosion caused by concentrated sheet flow coming off the roof. Foundation plantings can reduce the physical impact of water on the soil and provide a subsurface matrix of roots that encourage infiltration. These plantings must be sturdy enough to tolerate the heavy runoff sheet flows, and periodic soil saturation.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Efficient Irrigation SD-12

Design Objectives

- ☑ Maximize Infiltration
- ☑ Provide Retention
- ☑ Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Irrigation water provided to landscaped areas may result in excess irrigation water being conveyed into stormwater drainage systems.

Approach

Project plan designs for development and redevelopment should include application methods of irrigation water that minimize runoff of excess irrigation water into the stormwater conveyance system.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Designing New Installations

The following methods to reduce excessive irrigation runoff should be considered, and incorporated and implemented where determined applicable and feasible by the Permittee:

- Employ rain-triggered shutoff devices to prevent irrigation after precipitation.
- Design irrigation systems to each landscape area's specific water requirements.
- Include design featuring flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines.
- Implement landscape plans consistent with County or City water conservation resolutions, which may include provision of water sensors, programmable irrigation times (for short cycles), etc.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Design timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the storm water drainage system.
- Group plants with similar water requirements in order to reduce excess irrigation runoff and promote surface filtration. Choose plants with low irrigation requirements (for example, native or drought tolerant species). Consider design features such as:
  - Using mulches (such as wood chips or bar) in planter areas without ground cover to minimize sediment in runoff
  - Installing appropriate plant materials for the location, in accordance with amount of sunlight and climate, and use native plant materials where possible and/or as recommended by the landscape architect
  - Leaving a vegetative barrier along the property boundary and interior watercourses, to act as a pollutant filter, where appropriate and feasible
  - Choosing plants that minimize or eliminate the use of fertilizer or pesticides to sustain growth
- Employ other comparable, equally effective methods to reduce irrigation water runoff.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Storm Drain Signage SD-13

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- ☑ Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Waste materials dumped into storm drain inlets can have severe impacts on receiving and ground waters. Posting notices regarding discharge prohibitions at storm drain inlets can prevent waste dumping. Storm drain signs and stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets.

Approach

The stencil or affixed sign contains a brief statement that prohibits dumping of improper materials into the urban runoff conveyance system. Storm drain messages have become a popular method of alerting the public about the effects of and the prohibitions against waste disposal.

Suitable Applications

Stencils and signs alert the public to the destination of pollutants discharged to the storm drain. Signs are appropriate in residential, commercial, and industrial areas, as well as any other area where contributions or dumping to storm drains is likely.

Design Considerations

Storm drain message markers or placards are recommended at all storm drain inlets within the boundary of a development project. The marker should be placed in clear sight facing toward anyone approaching the inlet from either side. All storm drain inlet locations should be identified on the development site map.

Designing New Installations

The following methods should be considered for inclusion in the project design and show on project plans:

- Provide stenciling or labeling of all storm drain inlets and catch basins, constructed or modified, within the project area with prohibitive language. Examples include “NO DUMPING

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

– DRAINS TO OCEAN" and/or other graphical icons to discourage illegal dumping.

- Post signs with prohibitive language and/or graphical icons, which prohibit illegal dumping at public access points along channels and creeks within the project area.

Note - Some local agencies have approved specific signage and/or storm drain message placards for use. Consult local agency stormwater staff to determine specific requirements for placard types and methods of application.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. If the project meets the definition of "redevelopment", then the requirements stated under " designing new installations" above should be included in all project design plans.

Additional Information

Maintenance Considerations

- Legibility of markers and signs should be maintained. If required by the agency with jurisdiction over the project, the owner/operator or homeowner's association should enter into a maintenance agreement with the agency or record a deed restriction upon the property title to maintain the legibility of placards or signs.

Placement

- Signage on top of curbs tends to weather and fade.
- Signage on face of curbs tends to be worn by contact with vehicle tires and sweeper brooms.

Supplemental Information

Examples

- Most MS4 programs have storm drain signage programs. Some MS4 programs will provide stencils, or arrange for volunteers to stencil storm drains as part of their outreach program.

Trash Storage Areas SD-32

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- ☑ Contain Pollutants
- Collect and Convey

Description

Trash storage areas are areas where a trash receptacle (s) are located for use as a repository for solid wastes. Stormwater runoff from areas where trash is stored or disposed of can be polluted. In addition, loose trash and debris can be easily transported by water or wind into nearby storm drain inlets, channels, and/or creeks. Waste handling operations that may be sources of stormwater pollution include dumpsters, litter control, and waste piles.

Approach

This fact sheet contains details on the specific measures required to prevent or reduce pollutants in stormwater runoff associated with trash storage and handling. Preventative measures including enclosures, containment structures, and impervious pavements to mitigate spills, should be used to reduce the likelihood of contamination.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Design requirements for waste handling areas are governed by Building and Fire Codes, and by current local agency ordinances and zoning requirements. The design criteria described in this fact sheet are meant to enhance and be consistent with these code and ordinance requirements. Hazardous waste should be handled in accordance with legal requirements established in Title 22, California Code of Regulation.

Wastes from commercial and industrial sites are typically hauled by either public or commercial carriers that may have design or access requirements for waste storage areas. The design criteria in this fact sheet are recommendations and are not intended to be in conflict with requirements established by the waste hauler. The waste hauler should be contacted prior to the design of your site trash collection areas. Conflicts or issues should be discussed with the local agency.

Designing New Installations

Trash storage areas should be designed to consider the following structural or treatment control BMPs:

- Design trash container areas so that drainage from adjoining roofs and pavement is diverted around the area(s) to avoid run-on. This might include berming or grading the waste handling area to prevent run-on of stormwater.
- Make sure trash container areas are screened or walled to prevent off-site transport of trash.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Use lined bins or dumpsters to reduce leaking of liquid waste.
- Provide roofs, awnings, or attached lids on all trash containers to minimize direct precipitation and prevent rainfall from entering containers.
- Pave trash storage areas with an impervious surface to mitigate spills.
- Do not locate storm drains in immediate vicinity of the trash storage area.
- Post signs on all dumpsters informing users that hazardous materials are not to be disposed of therein.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define "redevelopment" in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of " redevelopment" must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under "designing new installations" above should be followed.

Additional Information

Maintenance Considerations

The integrity of structural elements that are subject to damage (i.e., screens, covers, and signs) must be maintained by the owner/operator. Maintenance agreements between the local agency and the owner/operator may be required. Some agencies will require maintenance deed restrictions to be recorded of the property title. If required by the local agency, maintenance agreements or deed restrictions must be executed by the owner/operator before improvement plans are approved.

PUT A STOP to TSS

Removes Pollutants from Runoff Prior to Entering Waterways

Efficient System
Catches pollutants where they are easiest to catch, at the inlet.

Variable Design
Able to be retrofitted or used in new projects.

Treatment Train
Can be incorporated as part of a "Treatment Train".

No Standing Water
Helps to minimize bacteria and odor problems.

Focused Treatment
Removes petroleum hydrocarbons, trash and Total Suspended Solids (TSS).

Maximum Flexibility
Available in a variety of standard sizes to fit round and square inlets.

Economical
Earn a higher return on system investment.

Two-part stainless-steel insert to filter solids and oils/grease.

Easy to install, inspect and maintain, even on small and confined sites.

By the Numbers*:
Filter will remove up to 80% of Total Suspended Solids (TSS), at least 70% of oils and grease, and up to 40% of Total Phosphorus (TP) associated with organic debris as well as Polycyclic Aromatic Hydrocarbons (PAH) from oil leaks and spills.

*Approximate for urban street application.

Oldcastle Infrastructure™
A CRH COMPANY

How Rubberizer® (Fossil Rock) Products Work*

Rubberizer® transforms spilled hydrocarbons into a rubber-like solid on contact, and does not re-release when it is retrieved. The solidification process is non-chemical in nature allowing the US EPA to classify Rubberizer as a sorbent.

This product, which comes in booms, pillows or granular form, can be used to clean oil from bilges, deck spills, around hydraulic storage tanks, under hydraulic machinery, in all engineering spaces and most importantly, in any hydrocarbon fuel spill where leaking oil comes in contact with water.

Rubberizer has been used in clean-up operations around the world and is patented in 22 countries.

The key advantages of the Rubberizer product line when compared to many of the characteristics of the more conventional products include:

- Works on land or water borne spills
- Remains buoyant
- Solidifies and is landfill approved
- Resistant to leaching
- Does not release solidified oils under pressure
- Incinerates with less that .1% residual ash
- Reduces overall clean-up time
- Reduces overall costs

Rubberizer products sorb and transform into a rubber-like material similar to many petroleum based products like:

- Gasoline
- Jet Fuel
- Diesel Fuels
- Transformer Oils
- Hydraulic Oils
- Lube Oils
- Aromatic Solvents
- Chlorinated Solvents
- Light Crudes

Rubberizer particulate is a mixture of hydrocarbon polymers plus additives resulting in a grainy material used primarily for cleanup operations where sweeping and shoveling are involved. It can also be used for clarification of various emulsions, or solidification and removal of various petroleum based slicks from the surface of water which is in a controlled state.

This product, (and the booms and pillows) in which it is the filler, exhibit characteristics that include:

- Lightweight enabling rapid deployment and retrieval (apparent specific gravity approximately = 0.4)
- Rapid sorption and solidification (measured in minutes), hydrophobic (no affinity for water)
- Permanently buoyant (both before and after sorption)
- Will not release solidified liquids under pressure
- Resistant to leaching upon aqueous contact
- High sorbed liquid to sorbent ratios (nominally 5 parts liquid to 1 part sorbent)
- Minimal incineration residue (less than .1%)
- Little volume increase of sorbed liquids (15% in laboratory tests, nominally 25% in field applications)

One pound of this product will solidify into a rubber-like material up to 2/3 gallon of jet fuel, diesel, gasoline, transformer oil, hydraulic oils, light crude and many other liquids.

CATCH BASIN INSERT FILTER

Inspection and Maintenance Guide

DRAINAGE PROTECTION SYSTEMS
DPS
A division of
Oldcastle Infrastructure

Water

SCOPE:

Federal, State and Local Clean Water Act regulations and those of insurance carriers require that stormwater filtration systems be maintained and serviced on a recurring basis. The intent of the regulations is to ensure that the systems, on a continuing basis, efficiently remove pollutants from stormwater runoff thereby preventing pollution of the nation's water resources. These specifications apply to the FloGard+Plus® Catch Basin Insert Filter.

RECOMMENDED FREQUENCY OF SERVICE:

Drainage Protection Systems (DPS) recommends that installed FloGard+Plus Catch Basin Insert Filters be serviced on a recurring basis. Ultimately, the frequency depends on the amount of runoff, pollutant loading and interference from debris (leaves, vegetation, cans, paper, etc.); however, it is recommended that each installation be serviced a minimum of three times per year, with a change of filter medium once per year. DPS technicians are available to do an on-site evaluation, upon request.

RECOMMENDED TIMING OF SERVICE:

DPS guidelines for the timing of service are as follows:

1. For areas with a definite rainy season: Prior to, during and following the rainy season.
2. For areas subject to year-round rainfall: On a recurring basis (at least three times per year).
3. For areas with winter snow and summer rain: Prior to and just after the snow season and during the summer rain season.
4. For installed devices not subject to the elements (wash racks, parking garages, etc.): On a recurring basis (no less than three times per year).

SERVICE PROCEDURES:

1. The catch basin grate shall be removed and set to one side. The catch basin shall be visually inspected for defects and possible illegal dumping. If illegal dumping has occurred, the proper authorities and property owner representative shall be notified as soon as practicable.
2. Using an industrial vacuum, the collected materials shall be removed from the liner. (Note: DPS uses a truck-mounted vacuum for servicing FloGard+Plus catch basin inserts).
3. When all of the collected materials have been removed, the filter medium pouches shall be removed by unsnapping the tether from the D-ring and set to one side. The filter liner, gaskets, stainless steel frame and mounting brackets, etc., shall be inspected for continued serviceability. Minor damage or defects found shall be corrected on-the-spot and a notation made on the Maintenance Record. More extensive deficiencies that affect the efficiency of the filter (torn liner, etc.), if approved by the customer representative, will be corrected and an invoice submitted to the representative along with the Maintenance Record.
4. The filter medium pouches shall be inspected for defects and continued serviceability and replaced as necessary, and the pouch tethers re-attached to the liner's D-ring.
5. The grate shall be replaced.

REPLACEMENT AND DISPOSAL OF EXPOSED FILTER MEDIUM AND COLLECTED DEBRIS

The frequency of filter medium exchange will be in accordance with the existing DPS-Customer Maintenance Contract. DPS recommends that the medium be changed at least once per year. During the appropriate service, or if so determined by the service technician during a non-scheduled service, the filter medium will be replaced with new material. Once the exposed pouches and debris have been removed, DPS has possession and must dispose of it in accordance with local, state and federal agency requirements.

DPS also has the capability of servicing all manner of storm drain filters, catch basin inserts and catch basins without inserts, underground oil/water separators, stormwater interceptors and other such devices. All DPS personnel are highly qualified technicians and are confined-space trained and certified. Call us at (888) 950-8826 for further information and assistance.

PART 2 — PRODUCTS

2.1 Description

This specification describes a Catch Basin Filtration Device that removes sediment, debris, trash and petroleum hydrocarbons (oil and grease) from water flowing into the drainage inlets during low flows (first flush) without impeding the inlet's maximum design flow. Hydraulic calculations shall be supplied upon request.

The filtration device shall incorporate a sorbent capable of collecting and containing non-soluble pollutants including, but not limited to, petroleum hydrocarbons (oil and grease). Sorbent shall be contained in separate removable containers that can easily be replaced without removing the filter liner. Filtration device shall not rely on collected sediment, debris, trash or filter liner as the medium for hydrocarbon collection.

High capacity filtration devices shall incorporate a debris trap, designed to retain floatable pollutants during high flow periods and both an initial filtering bypass for moderate flows and an ultimate bypass for peak design flows. The installed device shall not impede drainage inlet's peak design flow prior to or after the device has reached its pollutant storage capacity.

2.2 Materials

Filtration device support frame and hardware shall be manufactured from Type 304 stainless steel. It shall be designed to support maximum anticipated loads from the collected pollutants and water.

Field modifications, welding or painting of the device shall not be allowed.

Device shall incorporate a removable filter liner made from a woven polypropylene monofilament geotextile with an apparent opening size less than 35 US Mesh and a clean flow rate of not less than 145 gallons per minute (gpm) per square foot, or stainless steel screen with opening size between 4 and 200 US Mesh. The use of a

non-woven geotextile filter liner shall not be allowed.

Sorbent shall be a hydrophobic material treated to attract and retain petroleum hydrocarbons and other non-soluble pollutants. It shall be non-biodegradable and non-leaching and contain no hazardous ingredients as defined by the U.S. Environmental Protection Agency (EPA).

2.3 Manufacturer

Each catch basin filter device shall be a FloGard as manufactured by Oldcastle Infrastructure, 7100 Longe St, Stockton, California 95206. Phone: (800) 579-8819.

PART 3 — EXECUTION

3.1 Installation

Installation of filtration device shall not require extensive modification of the catch basin and shall be performed by a manufacturer-approved installation contractor. Installation contractor shall be licensed and insured in accordance with agency requirements.

Filtration devices installed into grated, or combination grate with curb opening inlets shall be either supported by resting the support brackets on the grate bearing ledge (installed without the use of bolts or other anchoring devices) or mounted to the catch basin wall with easily removable separate wall mount brackets to allow for quick access to the piping system in the event of an emergency.

Devices for curb opening style inlets (no grate) shall be installed across the entire width of the curb opening and shall be secured to inlet wall, across and beneath the curb opening, using corrosion-resistant anchors (Type 304 stainless steel). The use of chains or cable to secure the device shall not be allowed.

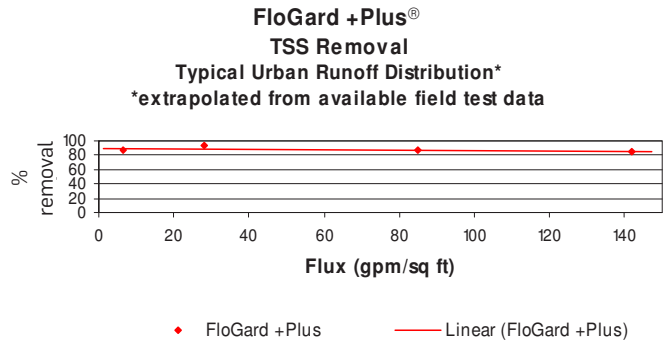
Filtration devices shall be installed in such a manner as to direct all flows into the device. Distance (gaps) between the inlet wall and the device shall not exceed one half inch. Gaps of less than one half inch shall be sealed with a flexible weatherproof sealant, as approved by agency.

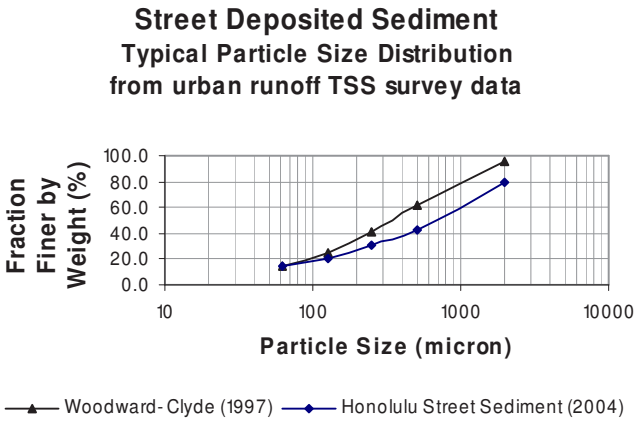
Installation contractor shall supply agency (engineer) with an installation record, denoting the date of installation, drainage inlet location, type of drainage inlet and type and/or size of filtration device.

Oldcastle Infrastructure™
A CRH COMPANY

FLOGARD +PLUS®

Independent field tests conducted in Hawaii and New Zealand on FloGard +PLUS® Catch Basin Insert Filters to determine removal efficiency of Total Suspended Solids (TSS). Results were extrapolated to a typical street deposited sediment particle size. Removal efficiencies were plotted and reflect effective TSS removal over a typical range of operating flow rates. Results are shown below as a function of unit internal surface area.





FloGard +PLUS® Catch Basin Insert Filter is an efficient inlet prefilter designed to remove suspended sediment and floatable trash and hydrocarbons from stormwater runoff in new or retrofit applications. It is ideally suited for removal of primary pollutants from paved surfaces in commercial and residential areas, or may form part of a treatment train. The device features a unique dual-bypass design, durable components, flexible installation options and easy maintenance access.

Units are sized to fit most common styles of drainage inlet grate frames or inlet widths. Rated filtered flow capacities for each model typically exceed the required "first flush" treatment flow rate, and account for reduction in capacity as the unit accumulates suspended pollutants. Rated bypass capacity for each model also typically exceeds the inlet capacity of the catch basin.

FloGard +PLUS® Test Results Summary

CDS Guide
Operation, Design, Performance and Maintenance

CDS®

Using patented continuous deflective separation technology, the CDS system screens, separates and traps debris, sediment, and oil and grease from stormwater runoff. The indirect screening capability of the system allows for 100% removal of floatables and neutrally buoyant material without blinding. Flow and screening controls physically separate captured solids, and minimize the re-suspension and release of previously trapped pollutants. Inline units can treat up to 6 cfs, and internally bypass flows in excess of 50 cfs (1416 L/s). Available precast or cast-in-place, offline units can treat flows from 1 to 300 cfs (28.3 to 8495 L/s). The pollutant removal capacity of the CDS system has been proven in lab and field testing.

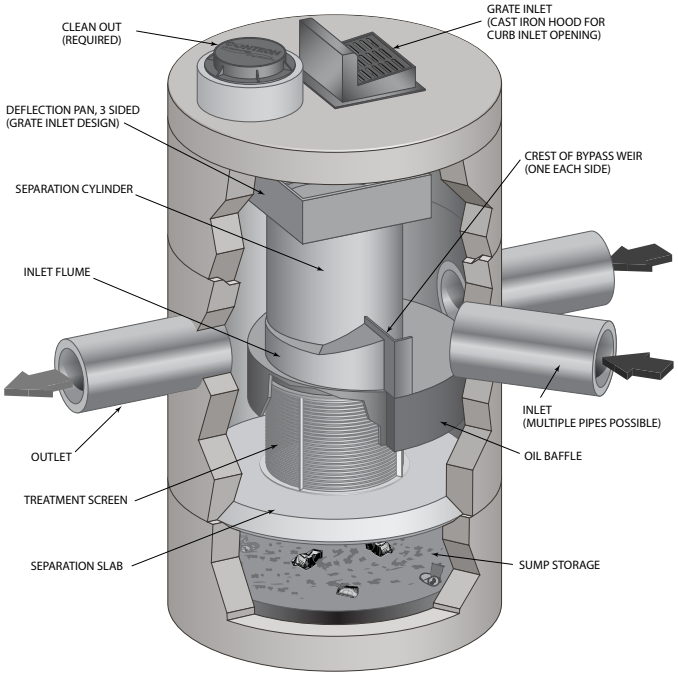
Operation Overview

Stormwater enters the diversion chamber where the diversion weir guides the flow into the unit's separation chamber and pollutants are removed from the flow. All flows up to the system's treatment design capacity enter the separation chamber and are treated.

Swirl concentration and screen deflection force floatables and solids to the center of the separation chamber where 100% of floatables and neutrally buoyant debris larger than the screen apertures are trapped.

Stormwater then moves through the separation screen, under the oil baffle and exits the system. The separation screen remains clog free due to continuous deflection.

During the flow events exceeding the treatment design capacity, the diversion weir bypasses excessive flows around the separation chamber, so captured pollutants are retained in the separation cylinder.



Design Basics

There are three primary methods of sizing a CDS system. The Water Quality Flow Rate Method determines which model size provides the desired removal efficiency at a given flow rate for a defined particle size. The Rational Rainfall Method™ or the and Probabilistic Method is used when a specific removal efficiency of the net annual sediment load is required.

Typically in the Unites States, CDS systems are designed to achieve an 80% annual solids load reduction based on lab generated performance curves for a gradation with an average particle size (d50) of 125 microns (μm). For some regulatory environments, CDS systems can also be designed to achieve an 80% annual solids load reduction based on an average particle size (d50) of 75 microns (μm) or 50 microns (μm).

Water Quality Flow Rate Method

In some cases, regulations require that a specific treatment rate, often referred to as the water quality design flow (WQQ), be treated. This WQQ represents the peak flow rate from either an event with a specific recurrence interval, e.g. the six-month storm, or a water quality depth, e.g. 1/2-inch (13 mm) of rainfall.

The CDS is designed to treat all flows up to the WQQ. At influent rates higher than the WQQ, the diversion weir will direct most flow exceeding the WQQ around the separation chamber. This allows removal efficiency to remain relatively constant in the separation chamber and eliminates the risk of washout during bypass flows regardless of influent flow rates.

Treatment flow rates are defined as the rate at which the CDS will remove a specific gradation of sediment at a specific removal efficiency. Therefore the treatment flow rate is variable, based on the gradation and removal efficiency specified by the design engineer.

Rational Rainfall Method™

Differences in local climate, topography and scale make every site hydraulically unique. It is important to take these factors into consideration when estimating the long-term performance of any stormwater treatment system. The Rational Rainfall Method combines site-specific information with laboratory generated performance data, and local historical precipitation records to estimate removal efficiencies as accurately as possible.

Short duration rain gauge records from across the United States and Canada were analyzed to determine the percent of the total annual rainfall that fell at a range of intensities. US stations' depths were totaled every 15 minutes, or hourly, and recorded in 0.01-inch increments. Depths were recorded hourly with 1-mm resolution at Canadian stations. One trend was consistent at all sites; the vast majority of precipitation fell at low intensities and high intensity storms contributed relatively little to the total annual depth.

These intensities, along with the total drainage area and runoff coefficient for each specific site, are translated into flow rates using the Rational Rainfall Method. Since most sites are relatively small and highly impervious, the Rational Rainfall Method is appropriate. Based on the runoff flow rates calculated for each intensity, operating rates within a proposed CDS system are

determined. Performance efficiency curve determined from full scale laboratory tests on defined sediment PSDs is applied to calculate solids removal efficiency. The relative removal efficiency at each operating rate is added to produce a net annual pollutant removal efficiency estimate.

Probabilistic Rational Method

The Probabilistic Rational Method is a sizing program Contech developed to estimate a net annual sediment load reduction for a particular CDS model based on site size, site runoff coefficient, regional rainfall intensity distribution, and anticipated pollutant characteristics.

The Probabilistic Method is an extension of the Rational Method used to estimate peak discharge rates generated by storm events of varying statistical return frequencies (e.g. 2-year storm event). Under the Rational Method, an adjustment factor is used to adjust the runoff coefficient estimated for the 10-year event, correlating a known hydrologic parameter with the target storm event. The rainfall intensities vary depending on the return frequency of the storm event under consideration. In general, these two frequency dependent parameters (rainfall intensity and runoff coefficient) increase as the return frequency increases while the drainage area remains constant.

These intensities, along with the total drainage area and runoff coefficient for each specific site, are translated into flow rates using the Rational Method. Since most sites are relatively small and highly impervious, the Rational Method is appropriate. Based on the runoff flow rates calculated for each intensity, operating rates within a proposed CDS are determined. Performance efficiency curve on defined sediment PSDs is applied to calculate solids removal efficiency. The relative removal efficiency at each operating rate is added to produce a net annual pollutant removal efficiency estimate.

Treatment Flow Rate

The inlet throat area is sized to ensure that the WQQ passes through the separation chamber at a water surface elevation equal to the crest of the diversion weir. The diversion weir bypasses excessive flows around the separation chamber, thus preventing re-suspension or re-entrainment of previously captured particles.

Hydraulic Capacity

The hydraulic capacity of a CDS system is determined by the length and height of the diversion weir and by the maximum allowable head in the system. Typical configurations allow hydraulic capacities of up to ten times the treatment flow rate. The crest of the diversion weir may be lowered and the inlet throat may be widened to increase the capacity of the system at a given water surface elevation. The unit is designed to meet project specific hydraulic requirements.

Performance

Full-Scale Laboratory Test Results

A full-scale CDS system (Model CDS2020-5B) was tested at the facility of University of Florida, Gainesville, FL. This CDS unit was evaluated under controlled laboratory conditions of influent flow rate and addition of sediment.

Two different gradations of silica sand material (UF Sediment & OK-110) were used in the CDS performance evaluation. The particle size distributions (PSDs) of the test materials were analyzed using standard method "Gradation ASTM D-422 "Standard Test Method for Particle-Size Analysis of Soils" by a certified laboratory.

UF Sediment is a mixture of three different products produced by the U.S. Silica Company: "Sil-Co-Sil 106", "#1 DRY" and "20/40 Oil Frac". Particle size distribution analysis shows that the UF Sediment has a very fine gradation (d50 = 20 to 30 μm) covering a wide size range (Coefficient of Uniformity, C averaged at 10.6). In comparison with the hypothetical TSS gradation specified in the NJDEP (New Jersey Department of Environmental Protection) and NJCAT (New Jersey Corporation for Advanced Technology) protocol for lab testing, the UF Sediment covers a similar range of particle size but with a finer d50 (d50 for NJDEP is approximately 50 μm) (NJDEP, 2003).

The OK-110 silica sand is a commercial product of U.S. Silica Sand. The particle size distribution analysis of this material, also included in Figure 1, shows that 99.9% of the OK-110 sand is finer than 250 microns, with a mean particle size (d50) of 106 microns. The PSDs for the test material are shown in Figure 1.

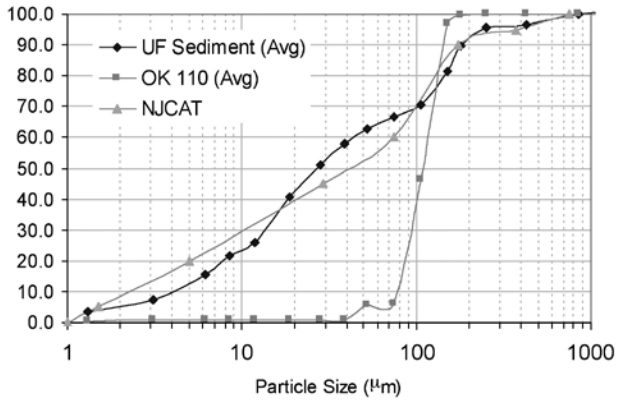


Figure 1. Particle size distributions

Tests were conducted to quantify the performance of a specific CDS unit (1.1 cfs (31.3-L/s) design capacity) at various flow rates, ranging from 1% up to 125% of the treatment design capacity of the unit, using the 2400 micron screen. All tests were conducted with controlled influent concentrations of approximately 200 mg/L. Effluent samples were taken at equal time intervals across the entire duration of each test run. These samples were then processed with a Dekaport Cone sample splitter to obtain representative sub-samples for Suspended Sediment Concentration (SSC) testing using ASTM D3977-97 "Standard Test Methods for Determining Sediment Concentration in Water Samples", and particle size distribution analysis.

Results and Modeling

Based on the data from the University of Florida, a performance model was developed for the CDS system. A regression analysis was used to develop a fitting curve representative of the scattered data points at various design flow rates. This model, which demonstrated good agreement with the laboratory data, can then be used to predict CDS system performance with respect

to SSC removal for any particle size gradation, assuming the particles are inorganic sandy-silt. Figure 2 shows CDS predictive performance for two typical particle size gradations (NJCAT gradation and OK-110 sand) as a function of operating rate.

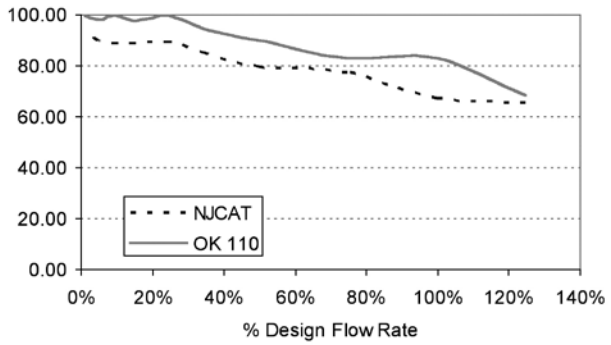

Figure 2. CDS stormwater treatment predictive performance for various particle gradations as a function of operating rate.

Many regulatory jurisdictions set a performance standard for hydrodynamic devices by stating that the devices shall be capable of achieving an 80% removal efficiency for particles having a mean particle size (d50) of 125 microns (e.g. Washington State Department of Ecology — WASDOE - 2008). The model can be used to calculate the expected performance of such a PSD (shown in Figure 3). The model indicates (Figure 4) that the CDS system with 2400 micron screen achieves approximately 80% removal at the design (100%) flow rate, for this particle size distribution (d50 = 125 μm).

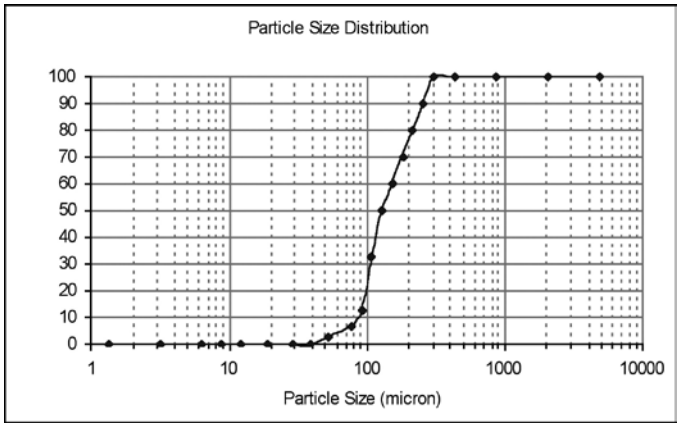

Figure 3. WASDOE PSD

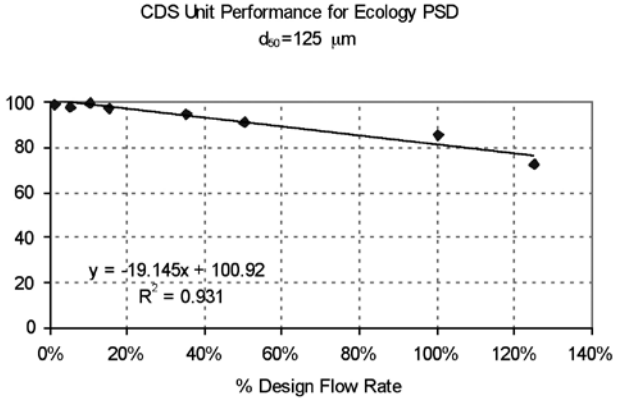

Figure 4. Modeled performance for WASDOE PSD.

Maintenance

The CDS system should be inspected at regular intervals and maintained when necessary to ensure optimum performance. The rate at which the system collects pollutants will depend more heavily on site activities than the size of the unit. For example, unstable soils or heavy winter sanding will cause the grit chamber to fill more quickly but regular sweeping of paved surfaces will slow accumulation.

Inspection

Inspection is the key to effective maintenance and is easily performed. Pollutant transport and deposition may vary from year to year and regular inspections will help ensure that the system is cleaned out at the appropriate time. At a minimum, inspections should be performed twice per year (e.g. spring and fall) however more frequent inspections may be necessary in climates where winter sanding operations may lead to rapid accumulations, or in equipment washdown areas. Installations should also be inspected more frequently where excessive amounts of trash are expected.

The visual inspection should ascertain that the system components are in working order and that there are no blockages or obstructions in the inlet and separation screen. The inspection should also quantify the accumulation of hydrocarbons, trash, and sediment in the system. Measuring pollutant accumulation can be done with a calibrated dipstick, tape measure or other measuring instrument. If absorbent material is used for enhanced removal of hydrocarbons, the level of discoloration of the sorbent material should also be identified

during inspection. It is useful and often required as part of an operating permit to keep a record of each inspection. A simple form for doing so is provided.

Access to the CDS unit is typically achieved through two manhole access covers. One opening allows for inspection and cleanout of the separation chamber (cylinder and screen) and isolated sump. The other allows for inspection and cleanout of sediment captured and retained outside the screen. For deep units, a single manhole access point would allows both sump cleanout and access outside the screen.

The CDS system should be cleaned when the level of sediment has reached 75% of capacity in the isolated sump or when an appreciable level of hydrocarbons and trash has accumulated. If absorbent material is used, it should be replaced when significant discoloration has occurred. Performance will not be impacted until 100% of the sump capacity is exceeded however it is recommended that the system be cleaned prior to that for easier removal of sediment. The level of sediment is easily determined by measuring from finished grade down to the top of the sediment pile. To avoid underestimating the level of sediment in the chamber, the measuring device must be lowered to the top of the sediment pile carefully. Particles at the top of the pile typically offer less resistance to the end of the rod than consolidated particles toward the bottom of the pile. Once this measurement is recorded, it should be compared to the as-built drawing for the unit to determine weather the height of the sediment pile off the bottom of the sump floor exceeds 75% of the total height of isolated sump.

Cleaning

Cleaning of a CDS systems should be done during dry weather conditions when no flow is entering the system. The use of a vacuum truck is generally the most effective and convenient method of removing pollutants from the system. Simply remove the manhole covers and insert the vacuum hose into the sump. The system should be completely drained down and the sump fully evacuated of sediment. The area outside the screen should also be cleaned out if pollutant build-up exists in this area.

In installations where the risk of petroleum spills is small, liquid contaminants may not accumulate as quickly as sediment. However, the system should be cleaned out immediately in the event of an oil or gasoline spill. Motor oil and other hydrocarbons that accumulate on a more routine basis should be removed when an appreciable layer has been captured. To remove these pollutants, it may be preferable to use absorbent pads since they are usually less expensive to dispose than the oil/water emulsion that may be created by vacuuming the oily layer. Trash and debris can be netted out to separate it from the other pollutants. The screen should be cleaned to ensure it is free of trash and debris.

Manhole covers should be securely seated following cleaning activities to prevent leakage of runoff into the system from above and also to ensure that proper safety precautions have been followed. Confined space entry procedures need to be followed if physical access is required. Disposal of all material removed from the CDS system should be done in accordance with local regulations. In many jurisdictions, disposal of the sediments may be handled in the same manner as the disposal of sediments removed from catch basins or deep sump manholes. Check your local regulations for specific requirements on disposal.

CDS Model	Diameter		Distance from Water Surface to Top of Sediment Pile		Sediment Storage Capacity

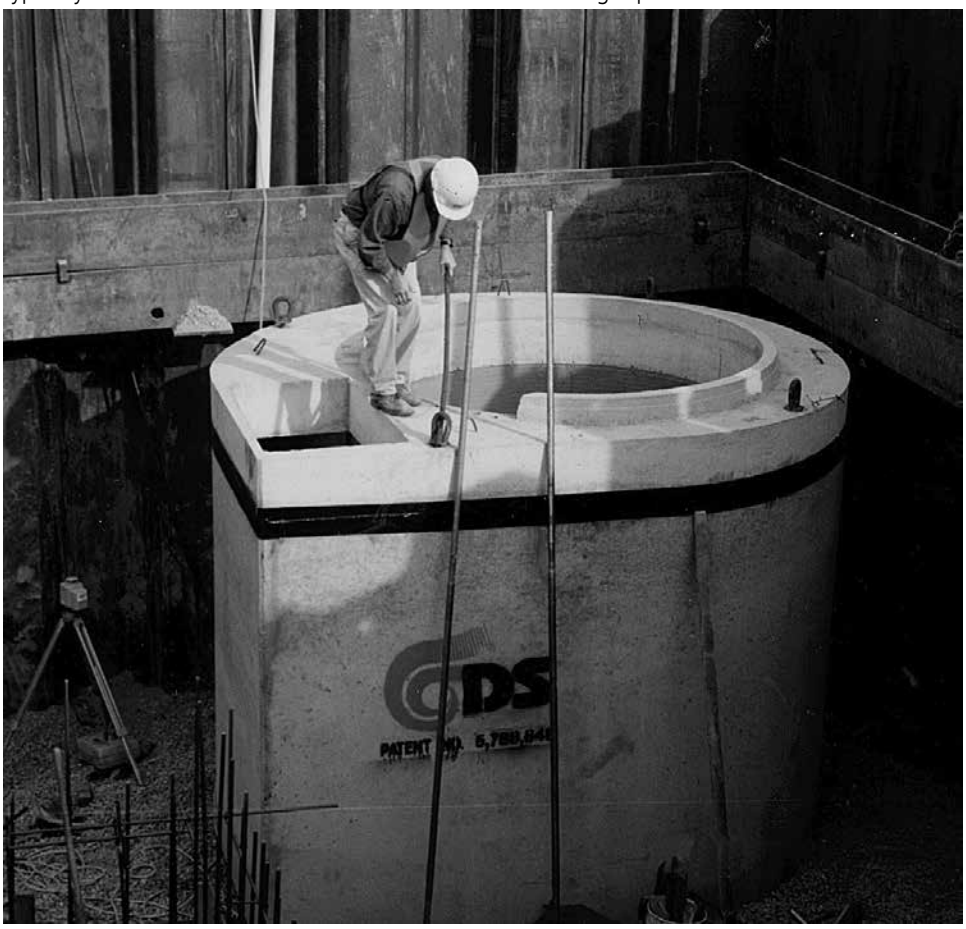
Table 1: CDS Maintenance Indicators and Sediment Storage Capacities

Note: To avoid underestimating the volume of sediment in the chamber, carefully lower the measuring device to the top of the sediment pile. Finer silty particles at the top of the pile may be more difficult to feel with a measuring stick. These finer particles typically offer less resistance to the end of the rod than larger particles toward the bottom of the pile.



CDS Inspection & Maintenance Log

CDS Model: _____ Location: _____

Date	Water depth to sediment[1]	Floatable Layer Thickness[2]	Describe Maintenance Performed	Maintenance Personnel	Comments

1. The water depth to sediment is determined by taking two measurements with a stadia rod: one measurement from the manhole opening to the top of the sediment pile and the other from the manhole opening to the water surface. If the difference between these measurements is less than the values listed in table 1 the system should be cleaned out. **Note: to avoid underestimating the volume of sediment in the chamber, the measuring device must be carefully lowered to the top of the sediment pile**.

2. For optimum performance, the system should be cleaned out when the floating hydrocarbon layer accumulates to an appreciable thickness. In the event of an oil spill, the system should be cleaned immediately.

RECYCLED PAPER

Project: American Way Industrial - DMA 'A'

Chamber Model -	MC-4500	
Units -	**Imperial**	Click Here for Metric
Number of Chambers -	30	
Number of End Caps -	4	
Voids in the stone (porosity) -	40	%
Base of STONE Elevation -	191.22	ft
Amount of Stone Above Chambers -	12	in
Amount of Stone Below Chambers -	9	in
Area of system -	1450	sf Min. Area - 1226 sf min. area

☑ Include Perimeter Stone in Calculations

Height of System (inches)	Incremental Single Chamber (cubic feet)	Incremental Single End Cap (cubic feet)	Incremental Chambers (cubic feet)	Incremental End Cap (cubic feet)	Incremental Stone (cubic feet)	Incremental Ch, EC and Stone (cubic feet)	Cumulative System (cubic feet)	Elevation (feet)

MC-4500 CHAMBER

Designed to meet the most stringent industry performance standards for superior structural integrity while providing designers with a cost-effective method to save valuable land and protect water resources. The StormTech system is designed primarily to be used under parking lots, thus maximizing land usage for private (commercial) and public applications. StormTech chambers can also be used in conjunction with Green Infrastructure, thus enhancing the performance and extending the service life of these practices.

STORMTECH MC-4500 CHAMBER
(not to scale)

Nominal Chamber Specifications

Size (L x W x H)
52” x 100” x 60”
1321 mm x 2540 mm x 1524 mm

Chamber Storage
106.5 ft^3 (3.01 m^3)

Min. Installed Storage*
162.6 ft^3 (4.60 m^3)

Weight
Nominal 125 lbs (56.7 kg)

Shipping
7 chambers/pallet
5 end caps/pallet
11 pallets/truck

*Assumes a minimum of 12” (300 mm) of stone above, 9” (230 mm) of stone below chambers, 9” (230 mm) of stone between chambers/end caps and 40% stone porosity.

STORMTECH MC-4500 END CAP
(not to scale)

Nominal End Cap Specifications

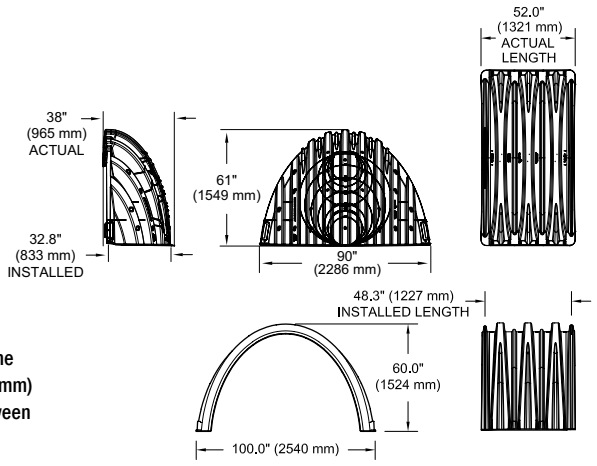
Size (L x W x H)
38” x 90” x 61”
965 mm x 2286 mm x 1549 mm

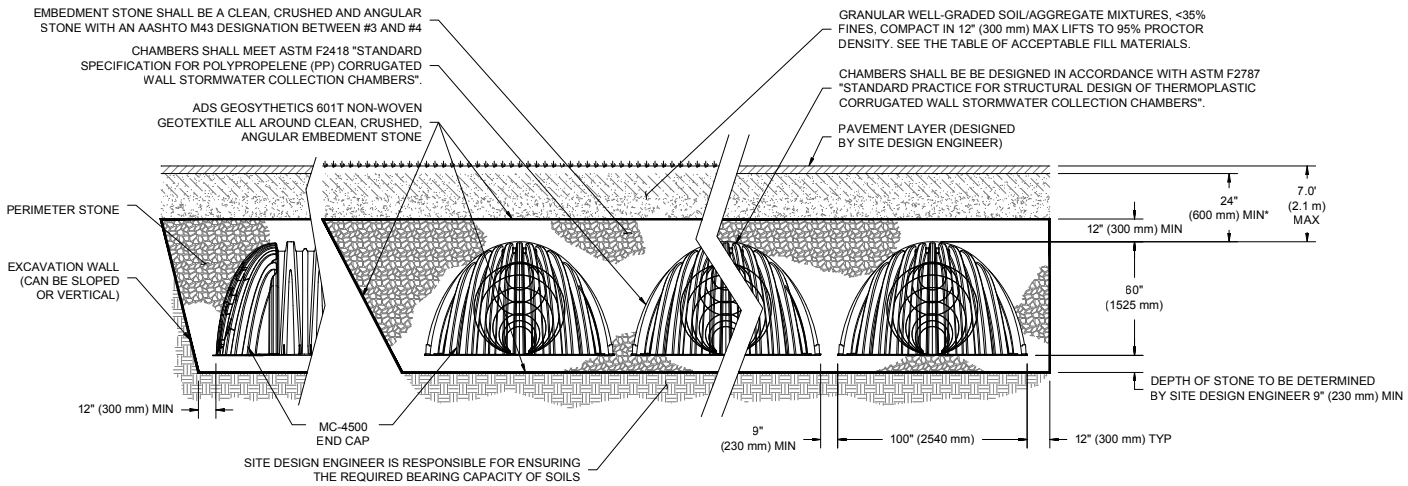
End Cap Storage
39.5 ft^3 (1.12 m^3)

Min. Installed Storage*
115.3 ft^3 (3.26 m^3)

Weight
Nominal 90.0 lbs (40.8 kg)

*Assumes a minimum of 12” (300 mm) of stone above, 9” (230 mm) of stone below, 12” (300 mm) of stone perimeter, 9” (230 mm) of stone between chambers/end caps and 40% stone porosity.





*MINIMUM COVER TO BOTTOM OF FLEXIBLE PAVEMENT. FOR UNPAVED INSTALLATIONS WHERE RUTTING FROM VEHICLES MAY OCCUR, INCREASE COVER TO 30" (750 mm).

MC-4500 CHAMBER SPECIFICATIONS

STORAGE VOLUME PER CHAMBER FT³ (M³)

	Bare Chamber Storage ft³ (m³)	Chamber and Stone Foundation Depth in. (mm)			
		9" (230 mm)	12" (300 mm)	15" (375 mm)	18" (450 mm)
MC-4500 Chamber	106.5 (3.01)	162.6 (4.60)	166.3 (4.71)	169.9 (4.81)	173.6 (4.91)
MC-4500 End Cap	39.5 (1.12)	115.3 (3.26)	118.6 (3.36)	121.9 (3.45)	125.2 (3.54)

Note: Assumes 9" (230 mm) row spacing, 40% stone porosity, 12" (300 mm) stone above and includes the bare chamber/end cap volume. End cap volume assumes 12" (300 mm) stone perimeter in front of end cap.

AMOUNT OF STONE PER CHAMBER

ENGLISH TONS (yds³)	Stone Foundation Depth			
	9"	12"	15"	18"
MC-4500 Chamber	7.4 (5.2)	7.8 (5.5)	8.3 (5.9)	8.8 (6.2)
MC-4500 End Cap	9.8 (7.0)	10.2 (7.3)	10.6 (7.6)	11.1 (7.9)
METRIC KILOGRAMS (m³)	230 mm	300 mm	375 mm	450 mm
MC-4500 Chamber	6713 (4.0)	7076 (4.2)	7529 (4.5)	7983 (4.7)
MC-4500 End Cap	8890 (5.3)	9253 (5.5)	9616 (5.8)	10069 (6.0)

Note: Assumes 12" (300 mm) of stone above and 9" (230 mm) row spacing and 12" (300 mm) of perimeter stone in front of end caps.

VOLUME EXCAVATION PER CHAMBER YD³ (M³)

	Stone Foundation Depth			
	9" (230 mm)	12" (300 mm)	15" (375mm)	18" (450 mm)
MC-4500 Chamber	10.5 (8.0)	10.8 (8.3)	11.2 (8.5)	11.5 (8.8)
MC-4500 End Cap	9.7 (7.4)	10.0 (7.6)	10.3 (7.9)	10.6 (8.1)

Note: Assumes 9" (230 mm) of separation between chamber rows, 12" (300 mm) of perimeter in front of the end caps, and 24" (600 mm) of cover. The volume of excavation will vary as depth of cover increases.

Isolator® Row O&M Manual

THE MOST **ADVANCED** NAME IN WATER MANAGEMENT SOLUTIONS™

ADS®

THE ISOLATOR® ROW

INTRODUCTION

An important component of any Stormwater Pollution Prevention Plan is inspection and maintenance. The StormTech Isolator Row is a technique to inexpensively enhance Total Suspended Solids (TSS) and Total Phosphorus (TP) removal with easy access for inspection and maintenance.

THE ISOLATOR ROW

The Isolator Row is a row of StormTech chambers, either SC-160, SC-310, SC-310-3, SC-740, DC-780, MC-3500 or MC-4500 models, that is surrounded with filter fabric and connected to a closely located manhole for easy access. The fabric-wrapped chambers provide for settling and filtration of sediment as storm water rises in the Isolator Row and ultimately passes through the filter fabric. The open bottom chambers and perforated sidewalls (SC-310, SC- 310-3 and SC-740 models) allow storm water to flow both vertically and horizontally out of the chambers. Sediments are captured in the Isolator Row protecting the storage areas of the adjacent stone and chambers from sediment accumulation.

A woven geotextile fabric is placed between the stone and the Isolator Row chambers. The woven geotextile provides a media for stormwater filtration, a durable surface for maintenance, prevents scour of the underlying stone and remains intact during high pressure jetting. A non-woven fabric is placed over the chambers to provide a filter media for flows passing through the perforations in the sidewall of the chamber. The non-woven fabric is not required over the SC-160, DC-780, MC-3500 or MC-4500 models as these chambers do not have perforated side walls.

The Isolator Row is typically designed to capture the “first flush” and offers the versatility to be sized on a volume basis or flow rate basis. An upstream manhole provides access to the Isolator Row and typically includes a high flow weir. When flow rates or volumes exceed the Isolator Row weir capacity the water will flow over the weir and discharge through a manifold to the other chambers.

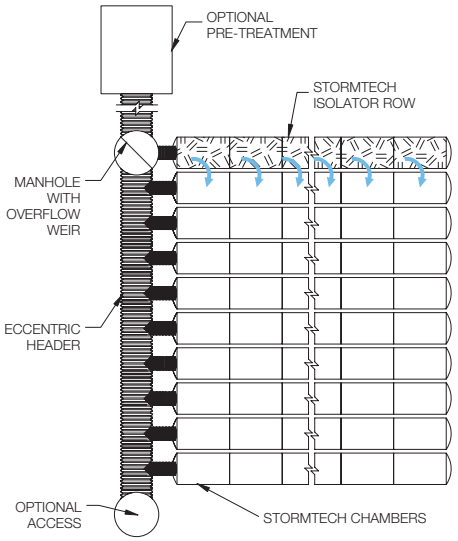
Another acceptable design uses one open grate inlet structure. Using a “high/low” design (low invert elevation on the Isolator Row and a higher invert elevation on the manifold) an open grate structure can provide the advantages of the Isolator Row by creating a differential between the Isolator Row and manifold thus allowing for settlement in the Isolator Row.

The Isolator Row may be part of a treatment train system. The design of the treatment train and selection of pretreatment devices by the design engineer is often driven by regulatory requirements. Whether pretreatment is used or not, the Isolator Row is recommended by StormTech as an effective means to minimize maintenance requirements and maintenance costs.

Note: See the StormTech Design Manual for detailed information on designing inlets for a StormTech system, including the Isolator Row.

Looking down the Isolator Row from the manhole opening, woven geotextile is shown between the chamber and stone base.

StormTech Isolator Row with Overflow Spillway (not to scale)



ISOLATOR ROW INSPECTION/MAINTENANCE

INSPECTION

The frequency of inspection and maintenance varies by location. A routine inspection schedule needs to be established for each individual location based upon site specific variables. The type of land use (i.e. industrial, commercial, residential), anticipated pollutant load, percent imperviousness, climate, etc. all play a critical role in determining the actual frequency of inspection and maintenance practices.

At a minimum, StormTech recommends annual inspections. Initially, the Isolator Row should be inspected every 6 months for the first year of operation. For subsequent years, the inspection should be adjusted based upon previous observation of sediment deposition.

The Isolator Row incorporates a combination of standard manhole(s) and strategically located inspection ports (as needed). The inspection ports allow for easy access to the system from the surface, eliminating the need to perform a confined space entry for inspection purposes.

If upon visual inspection it is found that sediment has accumulated, a stadia rod should be inserted to determine the depth of sediment. When the average depth of sediment exceeds 3 inches throughout the length of the Isolator Row, clean-out should be performed.

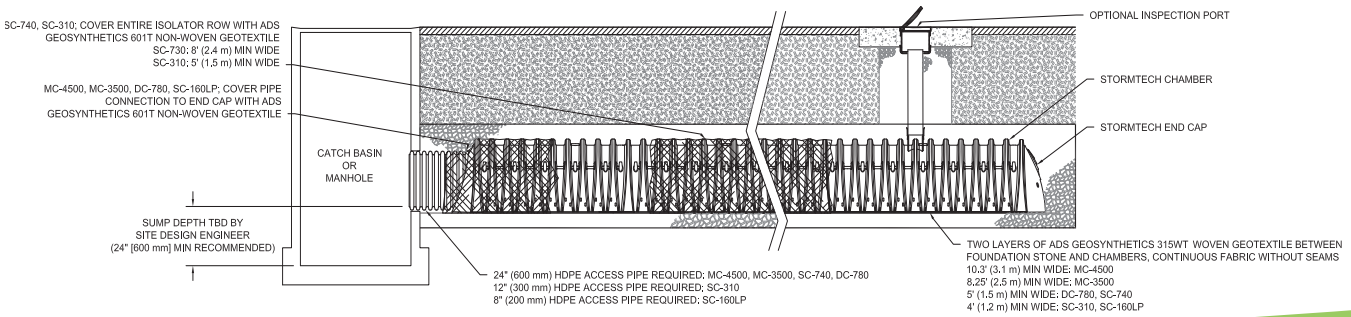
MAINTENANCE

The Isolator Row was designed to reduce the cost of periodic maintenance. By "isolating" sediments to just one row, costs are dramatically reduced by eliminating the need to clean out each row of the entire storage bed. If inspection indicates the potential need for maintenance, access is provided via a manhole(s) located on the end(s) of the row for cleanout. If entry into the manhole is required, please follow local and OSHA rules for a confined space entries.

Maintenance is accomplished with the JetVac process. The JetVac process utilizes a high pressure water nozzle to propel itself down the Isolator Row while scouring and suspending sediments. As the nozzle is retrieved, the captured pollutants are flushed back into the manhole for vacuuming. Most sewer and pipe maintenance companies have vacuum/JetVac combination vehicles. Selection of an appropriate JetVac nozzle will improve maintenance efficiency. Fixed nozzles designed for culverts or large diameter pipe cleaning are preferable. Rear facing jets with an effective spread of at least 45" are best. Most JetVac reels have 400 feet of hose allowing maintenance of an Isolator Row up to 50 chambers long. **The JetVac process shall only be performed on StormTech Isolator Rows that have AASHTO class 1 woven geotextile (as specified by StormTech) over their angular base stone.**

StormTech Isolator Row (not to scale)

Note: Non-woven fabric is only required over the inlet pipe connection into the end cap for SC-160LP, DC-780, MC-3500 and MC-4500 chamber models and is not required over the entire Isolator Row.



ISOLATOR ROW STEP BY STEP MAINTENANCE PROCEDURES

STEP 1

Inspect Isolator Row for sediment.

A) Inspection ports (if present)
   i. Remove lid from floor box frame
   ii. Remove cap from inspection riser
   iii. Using a flashlight and stadia rod,measure depth of sediment and record results on maintenance log.
   iv. If sediment is at or above 3 inch depth, proceed to Step 2. If not, proceed to Step 3.

B) All Isolator Rows
   i. Remove cover from manhole at upstream end of Isolator Row
   ii. Using a flashlight, inspect down Isolator Row through outlet pipe
      1. Mirrors on poles or cameras may be used to avoid a confined space entry
      2. Follow OSHA regulations for confined space entry if entering manhole
   iii. If sediment is at or above the lower row of sidewall holes (approximately 3 inches), proceed to Step 2. If not, proceed to Step 3.

STEP 2

Clean out Isolator Row using the JetVac process.

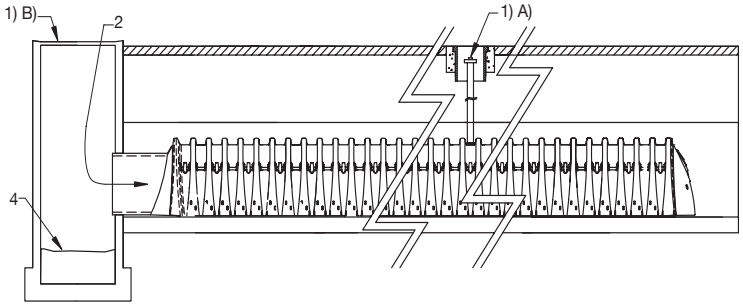
A) A fixed floor cleaning nozzle with rear facing nozzle spread of 45 inches or more is preferable
B) Apply multiple passes of JetVac until backflush water is clean
C) Vacuum manhole sump as required

STEP 3

Replace all caps, lids and covers, record observations and actions.

STEP 4

Inspect & clean catch basins and manholes upstream of the StormTech system.



SAMPLE MAINTENANCE LOG

Date	Stadia Rod Readings		Sediment Depth (1)–(2)	Observations/Actions	Inspector
	Fixed point to chamber bottom (1)	Fixed point to top of sediment (2)			
3/15/11	6.3 ft	none		New installation. Fixed point is CI frame at grade	DJM
9/24/11		6.2	0.1 ft	Some grit felt	SM
6/20/13		5.8	0.5 ft	Mucky feel, debris visible in manhole and in Isolator Row, maintenance due	NV
7/7/13	6.3 ft		0	System jetted and vacuumed	DJM

Project No. 13217.001

Rexford Industrial Realty & Management, Inc.
11620 Wilshire Boulevard, 10th Floor
Los Angeles, California 90025

Attention: Mr. Tomas Narbutas

Subject: Geotechnical Exploration Report
Proposed Industrial Buildings
2390-2442 North American Way
Orange, California

In accordance with our July 14, 2021 proposal, authorized on July 21, 2021, Leighton Consulting, Inc. (Leighton) has prepared this geotechnical exploration report for the subject project. We understand the proposed development concept includes demolition of the existing buildings and site improvements to allow construction of two new one-story industrial buildings. Based on review of the *Conceptual Site Plan (Scheme A.2)* prepared by GAA Architects, dated May 10, 2021, and discussions with you, we understand the proposed development consists of two (2) new one-story industrial buildings with total building areas of 49,600 square feet and 46,500 square feet, respectively. The proposed concrete tilt-up buildings will be constructed at grade with associated truck parking, truck loading and surface parking. Ancillary improvements likely consist of utility infrastructure, pavement, flatwork, and landscaping.

The purpose of our geotechnical exploration was to evaluate the subsurface conditions at the site, identify potential geologic and seismic hazards that may impact the project, and provide geotechnical recommendations for design and construction of the proposed improvements as currently planned.

The project is considered feasible from a geotechnical standpoint. The results of our exploration, conclusions and recommendations are presented in this report.

We appreciate the opportunity to be of service to you on this project. If you have any questions or if we can be of further service, please contact us at ***(866) LEIGHTON***; or specifically at the phone extensions or e-mail addresses listed below.

Respectfully submitted,

LEIGHTON CONSULTING, INC.

1.0 INTRODUCTION

1.1 Site Description and Proposed Development

The project site is located at 2390-2442 N. American Way in the city of Orange, Orange County, California. The site location (latitude 33.82853°, longitude -117.85886°) and immediate vicinity are shown on Figure 1, *Site Location Map.*

The project site is a 4-acre, irregular-shaped parcel of land currently occupied by an existing building associated with a cultural center, and several smaller buildings and miscellaneous structures and stockpiled materials that appear to be associated with a storage yard. The site is bordered by N. American Way, W. Freedom Avenue, and W. Fletcher Avenue. Access to the site is from the east via N. American Way.

The project site is relatively flat with sheet flow generally directed to the west. Review of the United States Geological Survey (USGS) 7.5-Minute Orange Quadrangle (USGS, 1981) indicates the ground surface at the site is between approximately Elevation (El.) +195 and +200 feet mean sea level (msl). The site is located immediately adjacent to and east of Orange County Water District's (OCWD) Fletcher Basin, a groundwater recharge basin and flood control facility, which we understand to be approximately 14 to 18 feet deep with surrounding slopes at approximate slope angles of 2:1 (horizontal:vertical) or flatter. The basin also contains a flat bench approximately 20 feet wide (access road) that surrounds the slopes descending into the basin bottom.

Based on review of historical aerial photographs (NETR, 2021), the site was vacant, undeveloped land until at least 1946. Between approximately 1946 and 1952, structures were constructed in the northeast portion of the site, including one of the existing homes. Between 1952 and 1963, the site appears to have been developed further with additional structures in the northeast and southeast portions of the site. The existing cultural center building located in the southern portion of the site was constructed between 1972 and 1980. The existing structures located along the northern boundary of the site were constructed between 1998 and 2000. The site appears to have the same configuration since 2000.

Based on discussions with you, we understand the proposed development concept includes demolition of the existing buildings and site improvements to allow construction of two new one-story industrial buildings. Based on our review of the *Conceptual Site Plan* (Scheme A.2) prepared by GAA Architects, dated May 10, 2021, and discussions with you, we understand the proposed development consists of two new one-story industrial buildings with total building areas of 49,600 square feet and 46,500 square feet. The proposed concrete tilt-up buildings will be constructed at grade with associated truck parking, truck loading, surface parking and associated utility infrastructure. Ancillary improvements likely consist of utility infrastructure, pavement, flatwork, and landscaping. Preliminary structural data was not available at the time of this report.

1.2 Purpose and Scope

The purpose of our geotechnical exploration was to evaluate the subsurface conditions at the site relative to the proposed development concept and provide geotechnical recommendations to aid in the design and construction for the project as currently planned. The scope of this geotechnical exploration included the following tasks:

- *Background Review* – We reviewed readily available in-house geotechnical reports, literature, aerial photographs, and maps relevant to the site. We evaluated geological hazards and potential geotechnical issues that may significantly impact the site. The documents reviewed are listed in Section 5.0.

- *Pre-Field Exploration Activities* – A site visit was performed by a member of our technical staff to mark the proposed exploration locations. Underground Service Alert (USA) was notified to locate and mark existing underground utilities prior to our subsurface exploration.

- *Field Exploration* – Our subsurface exploration was performed on July 23 and July 26, 2021; and included advancement of both hollow-stem auger borings and Cone Penetrometer Test (CPT) soundings. A total of four (4) hollow-stem auger borings (designated LB-1 through LB-4) were drilled, logged, and sampled to depths between approximately 43.5 and 50.9 feet below the existing ground surface (bgs). Refusal was encountered at 43.5 feet bgs in

boring LB-1 prior to reaching the target depth of 50 feet. A total of seven (7) CPT soundings (designated CPT-1 through CPT-6 and CPT-6A) were advanced at the site to depths ranging between approximately 11.2 and 30.9 feet bgs. Refusal was encountered in all seven (7) CPTs prior to reaching the target depth of 50 feet. Two (2) additional borings (designated LP-1 and LP-2) were drilled to an approximate depth of 10 feet bgs for subsequent percolation testing. The approximate locations of the explorations are shown on Figure 2, *Exploration Location Map.* The boring logs and CPT logs are presented in Appendix A, *Exploration Logs.*

During drilling of the borings, bulk and drive samples were obtained for geotechnical laboratory testing. Driven ring samples were collected from the borings using a Modified California ring-lined sampler conducted in accordance with ASTM Test Method D 3550. Standard Penetration Tests (SPTs) were also performed within the borings in accordance with ASTM Test Method D 1586. Samples were collected at 5-foot intervals throughout the depth of exploration. In both test methods, the sampler is driven below the bottom of the borehole by a 140-pound weight (hammer) free-falling 30 inches. The drilling rig was equipped with an automatic hammer to provide greater consistency in the drop height and striking frequency. The number of blows to drive the sampler the final 12 inches of the 18-inch drive interval is termed the “blowcount” or SPT N-value. The N-values provide a measure of relative density in granular (non-cohesive) soils and comparative consistency in cohesive soils. The number of blows per 6 inches of penetration was recorded on the boring logs, see Appendix A.

The borings were logged in the field by a geologist from our firm. Each soil sample collected was reviewed and described in accordance with the Unified Soil Classification System (USCS). The samples were sealed and packaged for transportation to our laboratory for testing. After completion of drilling, the borings were backfilled to the ground surface with soil cuttings and patched with cold-mix asphalt concrete at the surface to match existing conditions.

The CPT soundings were performed in accordance with ASTM D 5778 using a 15 cm^2 cone. Upon completion, each CPT was backfilled with cement-bentonite to the ground surface and patched with cold-mix asphalt concrete at the surface to match existing conditions. The approximate locations of the CPTs are shown on Figure 2, *Exploration Location Map.*

- *Percolation Testing* – Borings LP-1 and LP-2 were converted to temporary percolation test wells upon completion of drilling and sampling. The test wells consisted of 2-inch slotted (0.020") PVC well casing surrounded by #3 Monterey Sand placed in the annulus of the well within the test zone. In-situ percolation testing was performed in general accordance with the *Orange County Technical Guidance Document (TGD) for the Preparation of Conceptual/Preliminary and/or Project Water Quality Management Programs (WQMPs)* (OCPW, 2013). The results of the percolation testing are presented in Appendix B, *Percolation Test Data*. Refer to the discussion of infiltration rate presented in Section 2.4.1, *Infiltration*. Upon completion of the percolation testing, the well casing was removed from each boring and the borings were backfilled with soil cuttings and patched at the surface with cold-mix asphalt concrete to match existing site conditions.

- *Laboratory Testing* – Laboratory tests were performed on selected soil samples obtained from the borings during our field investigation. The laboratory testing program was designed to evaluate the physical and engineering characteristics of the onsite soils. Tests performed during this investigation include:

  - In-situ Moisture Content and Dry Density (ASTM D 2216 and ASTM D 2937);
  - Atterberg Limits (ASTM D 4318);
  - Direct Shear (ASTM D 3080);
  - Consolidation (ASTM D 2435);
  - Maximum Dry Density (ASTM D 1557);
  - Expansion Index (ASTM D 4829);
  - R-value; and
  - Corrosivity Suite – pH, Sulfate, Chloride, and Resistivity (California Test Methods 417, 422, and 532/643).

  Results of the in-situ moisture content and dry density testing are presented on the boring logs in Appendix A. Other laboratory test results are presented in Appendix C, *Laboratory Test Results.*

- *Engineering Analysis* – The data obtained from our background review and field exploration were evaluated and analyzed to develop recommendations for the proposed development.

- *Report Preparation* – This report presents our findings, conclusions, and recommendations for the proposed development.

2.0 GEOTECHNICAL FINDINGS

2.1 Regional Geologic Setting

The project site is located on the lowest reach of the Santa Ana River basin within the Peninsular Ranges geomorphic province. The Peninsular Ranges geomorphic province extends southward from the Los Angeles Basin to the tip of Baja California (Yerkes et al., 1965) and is characterized by elongated northwest-trending mountain ranges separated by sediment-floored valleys. The most dominant structural features of the province are the northwest trending fault zones, most of which die out, merge with, or are terminated by the steep reverse faults at the southern margin of the Transverse Ranges geomorphic province. East of the site are the northwest-trending Santa Ana Mountains, a large range which has been uplifted on its eastern side along the Whittier-Elsinore Fault Zone, producing a tilted, irregular highland that slopes westward toward the sea.

The area south and west of the Santa Ana Mountains is generally characterized as a broad, complex, alluvial fan, which receives sediments from the Santa Ana River and its tributaries draining the Santa Ana and San Bernardino Mountains. These sediments are comprised of relatively flat-lying, unconsolidated to loosely consolidated clastic deposits that are approximately 3,000 feet thick beneath the site (Sprotte et al., 1980; Real, 1985).

2.2 Surficial Geology

The site is located approximately 1,700 feet east of the Santa Ana River and immediately east of Fletcher Basin. The surficial deposits at the site and in the vicinity consist of Quaternary-aged youthful alluvial fan and floodplain deposits (alluvium) deposited by the Santa Ana River and tributaries (Bedrossian and Roffers, 2010; Morton and Miller, 2006). These unconsolidated alluvial sediments are comprised of generally flat-lying, non-marine deposits of sand, silt and clay. The surficial geologic units mapped in the vicinity of the project site are presented on Figure 3, *Regional Geology Map*.

2.3 Subsurface Conditions

Based on our subsurface explorations, the site is underlain by a thin layer of undocumented artificial fill materials (Afu) overlying Quaternary-aged young alluvial fan deposits (Qyf). The artificial fill encountered in our borings at the explored locations is generally about 3 feet in thickness across the site, likely associated with the existing and previous site improvements. The fill soils consist primarily of locally derived silty sand. Localized thicker accumulations of the fill materials should be anticipated between explored locations during future earthwork construction, particularly below the existing buildings. Below the artificial fill materials, young alluvial fan deposits (Qyf) were encountered in the borings to the maximum depth explored (50.9 feet bgs). The alluvial sediments generally consist of gray to light gray brown, moist, loose to very dense, poorly-graded sand with a layer of medium brown, medium stiff, lean clay to silty/sandy clay between approximately 15 and 30 feet bgs. Below approximately 30 feet, the alluvial sediments generally consist of reddish brown, dense to very dense, gravelly sand. The layer of gravely sand generally located at 30 feet bgs is likely what caused refusal of all of the CPTs, with the exception of CPT-6, which encountered refusal at approximately 11 feet bgs.

Detailed descriptions of the subsurface materials encountered in the borings are presented on the logs included in Appendix A. Some of the engineering properties of these soils are described in the following sections. The locations of the borings are shown on Figure 2, *Exploration Location Map*.

2.3.1 Expansive Soil Characteristics

Expansive soils contain significant amounts of clay particles that swell considerably when wetted and which shrink when dried. Foundations constructed on these soils are subject to uplifting forces caused by the swelling. Without proper mitigation measures, heaving and cracking of both building foundations and slabs-on-grade could result.

Two (2) near-surface bulk soil samples obtained during our subsurface exploration were tested for expansion potential. Both test results indicate and Expansion Index (EI) value of 0 (“very low” potential for expansion). The Expansion Index laboratory test results are included in Appendix C of this report.

Variance in expansion potential of onsite soil is anticipated; therefore, additional testing is recommended upon completion of site grading and excavation to confirm the expansion potential presented in this report. For purposes of this report, and based upon visual characterization of alluvial materials at approximate foundation depth, very low expansion potential of site materials may be considered to support design and verified upon completion of earthwork grading.

2.3.2 Soil Corrosivity

One (1) near-surface bulk soil samples obtained during our subsurface exploration was tested for corrosivity to assess corrosion potential to buried concrete. The chemical analysis test results for the onsite soil from our geotechnical exploration are included in Appendix C of this report.

The test results indicate a soluble sulfate concentration of 66 parts per million (ppm), chloride content of 80 ppm, pH value of 6.49, and minimum resistivity value of 6,700 ohm-cm.

The results of the resistivity test indicate the underlying soil is mildly corrosive to buried ferrous metals per ASTM STP 1013. Based on the measured water-soluble sulfate content from the soil sample, concrete in contact with the soil is expected to have negligible exposure to sulfate attack per ACI 318 (ACI, 2014). The sample tested for water-soluble chloride content indicate a low potential for corrosion of steel in concrete due to the chloride content of the soil.

2.3.3 Soil Compressibility

Four (4) samples of the onsite soils recovered from the borings were subjected to consolidation testing to evaluate the compressibility of these materials under assumed loads representative of anticipated structural bearing stresses. The results of testing indicate these soils exhibit low to moderate compressibility potential. The results of testing are presented in Appendix C.

2.3.4 Shear Strength

Evaluation of the shear strength characteristics of the soils included laboratory direct shear testing. The results of testing are included in Appendix C as well as summary graphs that provide values of angle of internal friction (ø) and cohesion (c) for use in geotechnical analysis.

2.3.5 Excavation Characteristics

Based on our subsurface explorations performed at the site and our experience from grading jobs in the vicinity of the site, we anticipate the onsite artificial fill and native earth materials can generally be excavated using conventional excavation equipment in good operating condition.

2.4 Groundwater Conditions

Groundwater was not encountered at the site during our subsurface exploration performed at the site to the maximum depth of 50.9 feet bgs. Based on review of the *Seismic Hazard Zone Report for the Orange Quadrangle* (CGS, 1997), the historically shallowest groundwater depth at the site is approximately 25 feet bgs. Based on review of available groundwater information from the California Department of Water Resources for a nearby groundwater monitoring well located approximately 0.5 mile northwest of the project site (State Well # 04S09W07N001S), the shallowest groundwater level measured for a monitoring period between June 1988 and February 2021 was approximately 96.6 feet bgs.

Based on these findings, groundwater is not expected to pose a constraint during or after construction. Fluctuations of the groundwater level, localized zones of perched water, and an increase in soil moisture, should be anticipated during and following the rainy seasons or periods of locally intense rainfall or storm water runoff, or from stormwater infiltration.

2.4.1 Infiltration

Percolation testing was performed in temporary wells installed within borings LP-1 and LP-2 located in the northern and southern portions of the site for a test zone at depths of approximately 5 to 10 feet bgs to evaluate the infiltration characteristics of subsurface soils. The percolation tests were conducted in general accordance with Orange County guidelines

(OCPW, 2013). Results of the percolation testing are presented in Appendix B. The test locations and zones tested are shown on Figure 2.

A boring percolation test is useful for field measurements of the infiltration rate of soils, and is suited for testing when the design depth of the infiltration device is deeper than current existing grades, especially in areas where it is difficult to dig test pits, or where the depths of these test pits would be considerably deep. At the subject site, testing consisted of advancing the borings to general depths anticipated for the invert of typical infiltration devices.

The percolation tests were performed using a constant-head method which records the approximate volume of water delivered to the test zone while maintaining a relatively constant height of water in the well over the testing period. Since the subsurface materials at this location were generally favorable for percolation (sandy soils), a water source was used to deliver water to the well at a relatively constant rate while recording the water height in the well. The measured infiltration rate for the constant-head percolation test was calculated by dividing the total volume of water infiltrated by the total duration of the test and dividing by the percolation surface area.

Detailed results of the field testing data and measured infiltration rate for the test well are presented in Appendix B. The test results are summarized in the table below:

Table 1 – Measured (Unfactored) Infiltration Rate

Test Well Designation	Approximate Depth of Test Zone (feet bgs)	Measured Infiltration Rate (inches per hour)
LP-1	5 to 10	110.5
LP-2	5 to 10	49.5

Based on the results of our field percolation testing that was performed at the site, the measured (unfactored) infiltration rates for the two (2) tests performed were 110.5 inches per hour (LP-1) and 49.5 inches per hour (LP-2), respectively. According to Orange County guidelines (OCPW,

2013), the measured infiltration rate at test wells LP-1 and LP-2 are well above the minimum feasibility criteria of 0.3 inch per hour.

2.5 Surface Fault Rupture

Our review of available literature indicates that no known active faults have been mapped across the site, and the site is **not** located within a currently established *Alquist-Priolo Earthquake Fault Zone* (Bryant and Hart, 2007). Therefore, a surface fault rupture hazard evaluation is not mandated for this site and the potential for surface fault rupture at the site is considered low.

The location of the closest active faults to the site was evaluated using the United States Geological Survey (USGS) Earthquake Hazards Program National Seismic Hazard Maps (USGS, 2008). The closest active fault to the site with the potential for surface fault rupture is the Elsinore, located approximately 6.5 miles from the site. The San Andreas fault, which is the largest active fault in California, is approximately 37.9 miles northeast of the site on the north side of the San Gabriel Mountains. Major regional faults with surface expression in proximity to the site are shown on Figure 4, *Regional Fault and Historical Seismicity Map*.

2.6 Strong Ground Shaking

The principal seismic hazard to the site is ground shaking resulting from an earthquake occurring along any of several major active and potentially active faults in southern California (Figure 4). The intensity of ground shaking at a given location depends primarily upon the earthquake magnitude, the distance from the source, and the site response characteristics.

Accordingly, design of the project should be performed in accordance with all applicable current codes and standards utilizing the appropriate seismic design parameters to reduce seismic risk as defined by California Geological Survey (CGS) Chapter 2 of Special Publication 117A (CGS, 2008). The 2019 edition of the California Building Code (CBC) is the current edition of the code. Through compliance with these regulatory requirements and the utilization of appropriate seismic design parameters selected by the design professionals, potential effects relating to seismic shaking can be reduced.

The following code-based seismic parameters should be considered for design under the 2019 CBC:

Table 2 – 2019 CBC Based Ground Motion Parameters (Mapped Values)

Categorization/Coefficient	Code-Based
Site Latitude	33.828535°
Site Longitude	-117.858864°
Site Class	D
Mapped Spectral Response Acceleration at Short Period (0.2 sec), S_S	1.495 g
Mapped Spectral Response Acceleration at Long Period (1 sec), S_1	0.529 g
Short Period (0.2 sec) Site Coefficient, F_a	1
Long Period (1 sec) Site Coefficient, F_v	null[1]
Adjusted Spectral Response Acceleration at Short Period (0.2 sec), S_{MS}	1.495 g
Adjusted Spectral Response Acceleration at Long Period (1 sec), S_{M1}	null[1]
Design Spectral Response Acceleration at Short Period (0.2 sec), S_{DS}	0.996 g
Design Spectral Response Acceleration at Long Period (1 sec), S_{D1}	null[1]
Site-adjusted geometric mean Peak Ground Acceleration, PGA_M	0.694 g

[1]Per Exception 2 in Section 11.4.8 of ASCE 7-16, seismic response coefficient C_S to be determined by Eq. 12.8-2 for values of $T \leq 1.5T_s$ and taken as equal to 1.5 times the value computed in accordance with either Eq. 12.8-3 for $T_L \geq T > 1.5T_s$ or Eq. 12.8-4 for $T > T_L$

2.7 Liquefaction Potential

The term liquefaction is generally referenced to loss of strength and stiffness in soils due to build-up of pore water pressure when subject to cyclic or monotonic loading. Both sandy and clayey soils are susceptible to loss of strength and stiffness. Because of the difference in strength characteristic and methods for evaluating strength loss potential for granular and clayey soils, the term liquefaction is used for granular soils while cyclic softening is used for fine-grained soils (i.e. clays and plastic silts).

In general, adverse effects of liquefaction or cyclic softening include excessive ground settlement, loss of bearing support for structural foundations, and seismically-induced lateral ground deformations such as lateral spreading. Depending upon the relative thickness of the liquefied strata with respect to

overlying non-liquefiable soils, other potentially adverse effects such as ground oscillation and ground fissuring may occur.

As shown on the *Seismic Hazard Zones* map for the Orange Quadrangle (CGS, 1998), the project site **is** located within an area that has been identified by the State of California as being potentially susceptible to liquefaction (Figure 5, *Seismic Hazard Map*). In addition, the historically shallowest depth to groundwater at the site is approximately 25 feet bgs. However, groundwater was not encountered during our subsurface exploration to the maximum depth of 50.9 feet bgs.

As a part of this geotechnical exploration, we have evaluated the liquefaction potential at the site using the data obtained from the soil borings with the computer program *LiqSVs* (v.2.0.2.1). Based on our evaluation using the using the Maximum Considered Earthquake (MCE) and a design groundwater level of 25 feet bgs for the soil borings performed at the site, the potential for liquefaction to occur at the site is low. The results of our analysis are presented in Appendix D, *Liquefaction Analysis.* The data obtained from the CPTs was not used in our analysis since refusal was encountered in all CPTs at depths significantly shallower than a depth of 50 feet required for the analysis.

2.8 Seismically-Induced Settlement

Seismically-induced settlement consists of dynamic settlement of unsaturated soil (above groundwater) and liquefaction-induced settlement (below groundwater). These settlements occur primarily within low density sandy soil due to reduction in volume during and shortly after an earthquake event.

As a part of the liquefaction analysis, we estimated the corresponding seismically-induced ground deformations using the computer program *LiqSVs* (v.2.0.2.1). Based on the results of our analysis, the total seismically-induced settlement is estimated to be up to about 1½ inches. It should be noted that our analysis indicates the seismically-induced settlement estimated for the site consists entirely of dynamic settlement above the design groundwater level since the soils below this level are dense to very dense and are not considered liquefiable. The results of our analysis are presented in Appendix D. The differential settlement is about ¼ inch or less over a horizontal distance of 30 feet.

2.9 Lateral Spreading

Liquefaction may also cause lateral spreading. For lateral spreading to occur, the liquefiable zone must be continuous, unconstrained laterally, and free to move along gently sloping ground toward an unconfined area. Since the potential for liquefaction is considered low based on the results of our analysis, the potential for lateral spreading due to liquefaction is also considered low.

2.10 Earthquake-Induced Landsliding

As shown on Figure 5, the site is **not** mapped within a seismically-induced landslide hazard zone identified by the State of California (CGS, 1998). In addition, due to project site being relatively flat, it is our opinion that the potential for seismically-induced landslide hazard at the site is not considered a hazard at the site.

2.11 Flooding

According to a Federal Emergency Management Agency (FEMA) flood insurance rate map (FEMA, 2009), the project site is located within a flood hazard area identified as "Zone X", which is defined as an area with reduced flood risk due to levee. As shown on Figure 6, *Flood Hazard Zone Map*, the site is **not** located within a 500-year flood hazard zone. Regionally, storm runoff flow is generally directed to the southwest.

Earthquake-induced flooding can be caused by failure of dams or other water-retaining structures as a result of earthquakes. According to information obtained from the State of California Division of Safety of Dams (DSOD) and shown on Figure 7, *Dam Inundation Map*, the site **is** mapped within a dam inundation zone associated with Prado Dam. However, due to the location and distance of the site from Prado Dam, the potential for earthquake-induced flooding to occur due to a failure of this dam is considered low. Catastrophic failure of this dam is expected to be a very unlikely event in that dam safety regulations exist and are enforced by the DOSD, Army Corps of Engineers and Department of Water Resources. Inspectors may require dam owners to perform work, maintenance or implement controls if issues are found with the safety of the dam.

2.12 Seiches and Tsunamis

Seiches are large waves generated in enclosed bodies of water in response to ground shaking. Tsunamis are waves generated in large bodies of water by fault displacement or major ground movement. Since the site is located immediately adjacent to Fletcher Basin, a groundwater recharge and flood control facility, there is a potential for seiche impact to the site in the event the basin is full of water at the time of a large earthquake event. Based on the inland location of the site, tsunami risk at the site is considered negligable.

2.13 Methane

Based on review of State of California Geologic Energy Management Division (CalGEM) records, the project site is **not** located within a documented oil field and there are no documented oil wells onsite (CalGEM, 2021). Based on these findings, methane is not considered a hazard at the site.

3.0 GEOTECHNICAL DESIGN RECOMMENDATIONS

Based on this study, we conclude that the proposed development for the subject site is feasible from a geotechnical standpoint, provided that the recommendations presented in this report are properly incorporated in design and construction.

The proposed structures may be supported on shallow spread-type foundations established in engineered fill. Due to the proximity of the Fletcher Basin and its associated descending slopes located immediately west of the site, it is recommended that the proposed building foundations and other structural improvements be set back at distance equal to a 3:1 (horizontal:vertical) projected from the bottom of the basin. The floor slab may be supported directly on grade. There may be existing underground utilities that will also be impacted. Information on these utilities should be provided to Leighton for evaluation. All existing undocumented fill is recommended to be removed from below the proposed building pad and other structural improvements prior to placement of engineered fill.

The recommendations below are based upon the exhibited geotechnical engineering properties of the soils and their anticipated response both during and after construction. The recommendations are also based upon proper field observation and testing during construction. The project geotechnical engineer should be notified of suspected variances in field conditions to determine the effect upon the recommendations subsequently presented. These recommendations are considered minimal and may be superseded by more restrictive requirements of the civil and structural engineers, the City of Orange, the County of Orange and other governing agencies.

Leighton should review the grading plans, foundation plans and project specifications as they become available to verify that the recommendations presented in this report have been incorporated into the plans for this project.

3.1 Site Grading

All site grading should be performed in accordance with the applicable local codes and in accordance with the project specifications that are prepared by the appropriate design professional. Earthwork for the project is expected to include overexcavation and recompaction of existing fill soils below new improvement footprints. Leighton should review the final grading plan and landscape plan when it becomes available to verify the recommendations in this report.

3.1.1 Site Preparation

Prior to construction, the site should be cleared of any vegetation, trash, former foundation remnants and/or debris within the area of proposed grading. These materials should be removed from the site. Any underground obstructions onsite should be removed. Efforts should be made to locate any existing utility lines to be removed or rerouted where interfering with the proposed construction. Any resulting cavities should be properly backfilled and compacted. After the site is cleared, the soils should be carefully observed for the removal of all unsuitable deposits.

3.1.2 Removals and Overexcavations

To provide uniform foundation support and reduce the potential for excessive static settlement, all existing undocumented fill and any unsuitable soil, as deemed by the geotechnical engineer, should be removed to expose suitable native soils and replaced as engineered fill below the proposed building and other structural improvements. Based on our field explorations, we estimate removals of existing undocumented fill will be approximately 3 feet below existing grade across most of the site. Localized areas will require deeper removals. Loose natural soils were encountered down to 10 feet bgs at borings LB-1 and LB-4, which will require removal and replacement as engineered fill. Unexplored portions of the site including areas beneath existing buildings and in areas of existing utilities, and areas disturbed during demolition of existing buildings and improvements may also require deeper removals.

Removals should be performed such that all undocumented fill is removed and replaced as engineered fill. In addition, overexcavations should be performed such that a minimum of 3 feet of engineered fill is established below the proposed building foundation elements. The lateral extent of overexcavation beyond foundations should be equal to the depth of overexcavation below the proposed foundations. The depth of overexcavation in non-structural areas planned for new pavement construction is recommended to be 2 feet below the current grade or planned subgrade elevation to develop a suitable bearing subgrade for pavement support. Deeper overexcavations in localized areas may be

recommended during grading by a representative of the geotechnical engineer depending on observed subsurface conditions.

3.1.3 Excavation Bottom Preparation

All excavation bottoms or removal bottoms should be observed by a representative of the geotechnical engineer prior to placement of fill or other improvements to determine that geotechnically suitable soil is exposed. Excavation bottoms observed to be suitable for fill placement or other improvements should be scarified to a depth of at least 8 inches, moisture-conditioned as necessary to achieve a moisture content of at least 2 percentage points above the optimum moisture content, and then compacted to a minimum of 90 percent of the laboratory derived maximum density as determined by ASTM Test Method D 1557 (Modified Proctor).

3.1.4 Fill Materials

On-site soil that is free of construction debris, organics, cobbles, boulders, rubble, or rock larger than 4-inches in largest dimension is suitable to be used as fill for support of structures. Any imported fill soil should be approved by the geotechnical engineer prior to import or use onsite.

3.1.5 Fill Placement and Compaction

Fill soils should be placed in loose lifts not exceeding 8 inches, moisture-conditioned to at least 2 percent above optimum moisture content, and compacted to a minimum of 90 percent of the maximum dry density as determined by ASTM Test Method D 1557. Aggregate base should be compacted to a minimum of 95 percent relative compaction.

When grading is interrupted by heavy rains, fill operations should not be resumed until the moisture content and the dry density of the placed fill are satisfactory.

3.1.6 Shrinkage

The change in volume of excavated and recompacted soil varies according to soil type and location. This volume change is represented as a percentage increase (bulking) or decrease (shrinkage) in volume of fill

after removal and recompaction. Field and laboratory data used in our calculations included laboratory-measured maximum dry density for the general soil type encountered at the subject site, the measured in-place densities of near surface soils encountered and our experience.

Based upon the results of the in-place density and the moisture-density relationship exhibited by representative bulk samples of the near surface soils, recompaction of the soils is anticipated to result in volume shrinkage in the range of 10 to 15 percent. The estimated shrinkage does not include material losses due to removal of organic material or other unsuitable bearing materials (debris, rubble, oversize material greater than 6-inches) and the actual shrinkage that occurs during grading may vary throughout the site.

3.1.7 Reuse of Concrete and Asphalt Rubble

If encountered during site clearing and/or during preparation activities, construction rubble (i.e., Portland cement concrete and asphalt concrete) may be incorporated in the proposed development. For use as structural fill, the processed material should be crushed to develop a relatively well-graded mixture with a maximum particle size of 3-inch nominal diameter. Concrete rubble should be free of rebar; processed asphalt pavement rubble may be used if mixed with the existing base course (where present) and soils in proportion of 1 part processed asphalt to 3 parts soil. For use as pavement base course, rubble should be crushed to satisfy gradation requirements of Section 200-2.4 of the SSPWC. Such materials must be free of and segregated from any hazardous materials and/or organic material of any kind

3.2 Foundation Design

Conventional spread footings established in engineered fill may be used to support proposed structural elements. Due to the proximity of the Fletcher Basin and its associated descending slopes located immediately west of the site, it is recommended that the proposed building foundations and other structural improvements be set back at distance equal to a 3:1 (horizontal:vertical) projected from the bottom of the basin.

Footings should be embedded a minimum 18 inches below the lowest adjacent grade. An allowable soil bearing pressure of 3,000 pounds per square foot (psf) may be used for footings with a minimum width of 18 inches for continuous footings and 24 inches for isolated footings. A one-third increase in the bearing value for short duration loading, such as wind or seismic forces may be used. The recommended bearing value is a net value, and the weight of concrete in the footings can be taken as 50 pounds per cubic foot (pcf); the weight of soil backfill can be neglected when determining the downward loads.

The ultimate bearing capacity can be taken as 9,000 psf, which does not incorporate a factor of safety. A resistance factor of 0.45 should be used for initial bearing capacity evaluation with factored loads.

The allowable bearing capacity for shallow footings is based on a total static settlement of ½ inch. Differential settlement can be taken as half the total settlement over a horizontal distance of 30 feet.

For static loading, 50 pounds per cubic inch (pci) may be assumed as the modulus of subgrade reaction (*k*). For seismic loading, a *k* value of 150 pci may be assumed.

Since settlement is a function of footing size and contact bearing pressure, differential settlement can be expected between adjacent columns or walls where a large differential loading condition exists. Once developed by the structural engineer, we should review total dead and sustained live loads for each column including plan location and span distance, to evaluate if differential settlements between dissimilarly loaded columns will be tolerable. Excessive differential settlement can be mitigated with the use of reduced bearing pressures, deeper footing embedment, possibly changing overexcavation schemes and using imported base material under spread footings, or possibly other methods.

Resistance to lateral loads will be provided by a combination of friction between the soil and structure interface and passive pressure acting against the vertical portion of the footings structures. For calculating lateral resistance, a passive pressure of 300 psf per foot of depth to a maximum of 3,000 psf and a frictional coefficient of 0.30 may be used. Note that the passive and frictional coefficients do not include a factor of safety. The frictional resistance and the passive

resistance of the soils can be combined without reduction in determining the total lateral resistance.

3.3 Slabs-on-Grade

Concrete slabs may be designed using a modulus of subgrade reaction of 100 pci provided the subgrade is prepared as described in Section 3.1. From a geotechnical standpoint, we recommend slab-on-grade be a minimum 5 inches thick with No. 3 rebar placed at the center of the slab at 24 inches on center in each direction. The structural engineer should design the actual thickness and reinforcement based on anticipated loading conditions. Where moisture-sensitive floor coverings or equipment is planned, the slabs should be protected by a minimum 10-mil-thick vapor barrier between the slab and subgrade. A coefficient of friction of 0.35 can be used between the floor slab and the vapor barrier.

Minor cracking of concrete after curing due to drying and shrinkage is normal and should be expected; however, concrete is often aggravated by a high water/cement ratio, high concrete temperature at the time of placement, small nominal aggregate size, and rapid moisture loss due to hot, dry, and/or windy weather conditions during placement and curing. Cracking due to temperature and moisture fluctuations can also be expected. The use of low-slump concrete or low water/cement ratios can reduce the potential for shrinkage cracking. Additionally, our experience indicates that the use of reinforcement in slabs and foundations can generally reduce the potential but not eliminate for concrete cracking.

To reduce the potential for excessive cracking, concrete slabs-on-grade should be provided with construction or weakened plane joints at frequent intervals. Joints should be laid out to form approximately square panels.

3.4 Cement Type and Corrosion Protection

Based on the results of laboratory testing, concrete structures in contact with the onsite soil are expected to have negligible exposure to water-soluble sulfates in the soil. Common Type II cement may be used for concrete construction onsite and the concrete should be designed in accordance with 2019 CBC

requirements. However, concrete exposed to recycled water should be designed using Type V cement.

Based on our laboratory testing, the onsite soil is considered severely to very severely corrosive to ferrous metals. Ferrous pipe should be avoided by using high-density polyethylene (HDPE) or other non-ferrous pipe when possible. Ferrous pipe, if used, should be protected by polyethylene bags, tap or coatings, di-electric fittings or other means to separate the pipe from onsite soils.

3.5 Retaining Walls

Recommended lateral earth pressures are provided as equivalent fluid unit weights, in psf/ft. or pcf. These values do not contain an appreciable factor of safety, so the structural engineer should apply the applicable factors of safety and/or load factors during design.

Onsite soils are likely suitable to be used as retaining wall backfill due to its very low expansion potential; however, field and laboratory verification are recommended before use. Should site soil be considered for reuse behind retaining walls, it should be tested to ensure Expansion potential is less than 20 (EI<20). Recommended lateral earth pressures for retaining walls backfilled with sandy soils with drained conditions as shown on Figure 8, *Retaining Wall Backfill and Subdrain Detail* are as follows:

Table 3 – Retaining Wall Design Earth Pressures

Retaining Wall Condition (Level Backfill)	Equivalent Fluid Pressure (pounds-per-cubic-foot)*
Active (cantilever)	40
At-Rest (braced)	60
Passive Resistance (compacted fill)	250
Seismic Increment (add to active pressure)	20

Walls that are free to rotate or deflect may be designed using active earth pressure. For basement walls or walls that are fixed against rotation, the at-rest pressure should be used. For seismic condition, the pressure should be

distributed as an inverted triangular distribution and the dynamic thrust should be applied at a height of 0.6H above the base of the wall. In addition to the recommended earth pressures, walls below grade adjacent to existing structures or streets and areas of traffic should be designed to accommodate surcharge loads. For traffic surcharge, a uniform lateral pressure of 100 pounds per square foot acting as a result of an assumed 300 pounds per square foot surcharge behind the wall due to normal traffic; the traffic surcharge load may be neglected provided a minimum of 10-foot clearance between the wall and the traffic is maintained. We will provide surcharge loading from adjacent foundations after reviewing details of the planned basement walls in relation to existing foundations

3.5.1 Sliding and Overturning

Total depth of retained earth for design of walls and for uplift resistance, should be measured as the vertical height of the stem below the ground surface at the wall face for stem design, or measured at the heel of the footing for overturning and sliding. A soil unit weight of 120 pcf may be assumed for calculating the actual weight of the soil over the wall footing, if drained, or 60 pcf if submerged, for properly compacted backfill.

3.5.2 Drainage

Adequate drainage may be provided by a subdrain system positioned behind the walls. Typically, this system consists of a 4-inch minimum diameter perforated pipe placed near the base of the wall (perforations placed downward). The pipe should be bedded and backfilled with pervious backfill material described in Section 300-3.5.2 of the Standard Specifications for Public Works Construction (Green Book), 2018 Edition. This pervious backfill should extend at least 2 feet out from the wall and to within 2 feet of the outside finished grade. This pervious backfill and pipe should be wrapped in filter fabric, such as Mirafi 140N or equivalent, placed as described in Section 300-8.1 of the Standard Specifications for Public Works Construction (Green Book), 2018 Edition. The subdrain outlet should be connected to a free-draining outlet or sump.

Miradrain, Geotech Drainage Panels, or Enkadrain drainage geocomposites, or similar, may be used for wall drainage as an alternative to the Class 2 Permeable Material or drain rock backfill, particularly where horizontal space is limited adjacent to shoring (where walls are cast against shoring). These drainage panels should be connected to the perforated drainpipe at the base of the wall.

3.6 Paving

To provide support for paving, the subgrade soils should be prepared as recommended in the Section 3.1. Compaction of the subgrade, including trench backfills, to at least 90 percent of the maximum dry density as determined by ASTM Test Method D 1557, and achieving a firm, hard, and unyielding surface will be important for paving support. The preparation of the paving area subgrade should be performed immediately prior to placement of the base course.

Adequate drainage (both surface and subsurface) should be provided such that the subgrade soils and aggregate base materials are not allowed to become wet. Landscape areas must be separated from pavements with concrete curbs and/or edge drains. Excessive over-irrigation will have an adverse impact on adjacent pavements. Irrigation adjacent to pavements, without a deep curb or other cutoff to separate landscaping from paving, will result in premature pavement failure.

3.6.1 Asphalt Concrete

The required paving and base thicknesses will depend on the expected wheel loads and volume of traffic (Traffic Index or TI). Assuming that the paving subgrade will consist of engineered fill with an R-value greater than 50, compacted to at least 90 percent as recommended, the minimum recommended paving thicknesses are presented in the following table. Results of R-value testing on one (1) near surface sample of existing onsite soils indicate a value of 71.

Table 4 – Asphalt Concrete Pavement Sections

Traffic Index	Asphalt Concrete (inches)	Base Course (inches)
5	3	4
6	3	6
7	4	6
8	4	8
9	5	8

The asphalt paving sections were determined using the Caltrans design method. We can determine the recommended paving and base course thicknesses for other Traffic Indices if required. Careful inspection is recommended to verify that the recommended thicknesses or greater are achieved, and that proper construction procedures are followed.

3.6.2 Portland Cement Concrete Paving

Concrete slabs-on-grade should be underlain by at least 2 feet of relatively non-expansive materials. We have assumed that the subgrade below paving will have an R-value of at least 50. Portland cement concrete (PCC) paving sections were determined in accordance with procedures developed by the Portland Cement Association. Concrete paving sections for a range of Traffic Indices are presented in the following table. We have assumed that the Portland cement concrete will have a compressive strength of at least 4,000 pounds per square inch.

Table 5 – PCC Pavement Sections

Traffic Index	PCC (inches)	Base Course (inches)
5	5	4
6	5½	4
7	6	4
8	7	4
9	8	4

The paving should be provided with expansion joints at regular intervals no more than 15 feet in each direction. Load transfer devices, such as dowels or keys, are recommended at joints in the paving to reduce possible offsets. The paving sections in the above table have been developed based on the

strength of unreinforced concrete. Steel reinforcing may be added to the paving to reduce cracking and to prolong the life of the paving.

3.6.3 Base Course

The base course for both asphalt concrete and Portland cement concrete paving should meet the specifications for Class 2 Aggregate Base as defined in Section 26 of the latest edition of the State of California, Department of Transportation, Standard Specifications. Alternatively, the base course could meet the specifications for untreated base as defined in Section 200-2 of the latest edition of the Standard Specifications for Public Works Construction. The base course should be compacted to a minimum of 95 percent of the maximum dry density as determined by ASTM Test Method D 1557.

3.7 Infiltration BMP Design Considerations

It should be noted that the measured infiltration rates presented herein may degrade over time due to complete saturation of underlying soils, and fines build-up and plugging if pretreatment of the storm water is not performed. As such, a reduction of the measured infiltration rates using a factor of safety of at least 2 or more should be considered to establish a conservative infiltration rate for the service life of the system. This factor should not be less than 2, but may be higher at the discretion of the design engineer.

In general, a vast majority of geotechnical distress issues are related to improper drainage. Distress in the form of foundation movement could occur. Direct infiltration to the subsurface is not recommended adjacent to curb and gutter, public pavements or within 10 feet away from the design saturation zone as soil saturation could lead to a loss of soil support, settlement or collapse, and internal erosion (piping). The design saturation zone may be assumed as a 1:1 plane projected downward from the top of an infiltration device's discharge zone. Additionally, infiltration water will migrate along pipe backfill (typically sand or gravel bedding) affecting improvements far from the point of infiltration. Proposed direct open bottom infiltration systems, should be located as far away from existing or proposed foundations, rigid improvements and utilities as is practical in order to reduce the geotechnical distress issues related to water.

Where sufficient distance from improvements cannot be achieved, additional recommendations may be warranted and can be provided during plan review.

Prior to construction of any infiltration device intended for the site, the plans should be reviewed by the geotechnical consultant to verify that our geotechnical recommendations have been appropriately incorporated into the plans and not compromised by the addition of an infiltration system to the site. The designer of any infiltration system should contact the geotechnical consultant for geotechnical input during the design process as they feel necessary.

3.8 Temporary Excavations

All temporary excavations, including utility trenches, retaining wall excavations, and foundation excavations should be performed in accordance with project plans, specifications, and all OSHA requirements. Excavations 4 feet or deeper should be laid back or shored in accordance with OSHA requirements before personnel are allowed to enter.

No surcharge loads should be permitted within a horizontal distance equal to the height of cut or 5 feet, whichever is greater from the top of the cut, unless the cut is shored appropriately. Excavations that extend below an imaginary plane inclined at 45 degrees below the edge of any adjacent existing site foundation should be properly shored to maintain support of the adjacent structure.

Temporary excavations should be treated in accordance with the State of California version of OSHA excavation regulations, Construction Safety Orders for Excavation General Requirements, Article 6, Section 1541, effective October 1, 1995. The sides of excavations should be shored or sloped in accordance with OSHA regulations. OSHA allows the sides of unbraced excavations, up to a maximum height of 20 feet, to be cut to a ¾H:1V (horizontal:vertical) slope for Type A soils, 1H:1V for Type B soils, and 1½H:1V for Type C soils. Near-surface onsite soils are to be considered Type B soils.

During construction, the soil conditions should be regularly evaluated to verify that conditions are as anticipated. The contractor shall be responsible for providing the “competent person” required by OSHA standards to evaluate soil conditions. Close coordination between the competent person and the

geotechnical engineer should be maintained to facilitate construction while providing safe excavations.

3.9 Trench Backfill

Utility trenches should be backfilled with compacted fill in accordance with Sections 306-1 and 306-6 of the Standard Specifications for Public Works Construction, ("Greenbook"), 2018 Edition. Utility trenches can be backfilled with onsite sandy material free of rubble, debris, organic and oversized material up to (≤) 3-inches in largest dimension. Prior to backfilling trenches, pipes should be bedded in and covered with either:

(1) **Sand:** A uniform, sand material that has a Sand Equivalent (SE) greater-than-or-equal-to (≥) 30, passing the No. 4 U.S. Standard Sieve (or as specified by the pipe manufacturer), water densified in place, or

(2) **CLSM:** Controlled Low Strength Material (CLSM) conforming to Section 201-6 of the *Standard Specifications for Public Works Construction,* ("Greenbook"), 2018 Edition. CLSM should not be jetted.

Pipe bedding should extend at least 4 inches below the pipeline invert and at least 12 inches over the top of the pipeline. Native and clean fill soils can be used as backfill over the pipe bedding zone, and should be placed in thin lifts, moisture conditioned above optimum, and mechanically compacted to at least 90 percent relative compaction, relative to the ASTM D 1557 laboratory maximum density.

3.10 Drainage and Landscaping

Building walls below grade should be waterproofed or at least damp proofed, depending upon the degree of moisture protection desired. Surface drainage should be designed to direct water away from foundations and toward approved drainage devices. Irrigation of landscaping should be controlled to maintain, as much as possible, consistent moisture content sufficient to provide healthy plant growth without overwatering.

3.11 Additional Geotechnical Services

Leighton should review the grading plans, foundation plans, and specifications when they are available to verify that the recommendations presented in this report have been properly interpreted and incorporated.

Geotechnical observation and testing should be provided during the following activities:

- Grading and excavation of the site;
- Subgrade Preparation;
- Compaction of all fill materials;
- Utility trench backfilling and compaction;
- Footing excavation and slab-on-grade preparation;
- Pavement subgrade and base preparation;
- Placement of asphalt concrete and/or concrete; and
- When any unusual conditions are encountered.

4.0 LIMITATIONS

This geotechnical exploration does not address the potential for encountering hazardous soil at this site. In addition, this report was necessarily based in part upon data obtained from a limited number of observances, site visits, soil samples, tests, analyses, histories of occurrences, spaced subsurface explorations and limited information on historical events and observations. Such information is, by necessity, incomplete. Please also refer GBA's *Important Information About Your Geotechnical Report* (included at the rear of the text), presenting additional information and limitations regarding geotechnical engineering studies and reports. The nature of many sites is such that differing soil or geologic conditions can be present within small distances and under varying climatic conditions. Changes in subsurface conditions can and do occur over time. Therefore, the findings, conclusions, and recommendations presented in this report are only valid if Leighton Consulting, Inc. has the opportunity to observe subsurface conditions during grading and construction, to confirm that our data are representative for the site. Leighton Consulting, Inc. should also review the construction plans and project specifications, when available, to comment on the geotechnical aspects.

This report was prepared using the degree of care and skill ordinarily exercised, under similar circumstances, by reputable geotechnical consultants practicing at this time in Orange County. We do not make any warranty, either expressed or implied.

Important Information about This

Geotechnical-Engineering Report

Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.

While you cannot eliminate all such risks, you can manage them. The following information is provided to help.

The Geoprofessional Business Association (GBA) has prepared this advisory to help you – assumedly a client representative – interpret and apply this geotechnical-engineering report as effectively as possible. In that way, clients can benefit from a lowered exposure to the subsurface problems that, for decades, have been a principal cause of construction delays, cost overruns, claims, and disputes. If you have questions or want more information about any of the issues discussed below, contact your GBA-member geotechnical engineer. Active involvement in the Geoprofessional Business Association exposes geotechnical engineers to a wide array of risk-confrontation techniques that can be of genuine benefit for everyone involved with a construction project.

Geotechnical-Engineering Services Are Performed for Specific Purposes, Persons, and Projects

Geotechnical engineers structure their services to meet the specific needs of their clients. A geotechnical-engineering study conducted for a given civil engineer will not likely meet the needs of a civil-works constructor or even a different civil engineer. Because each geotechnical-engineering study is unique, each geotechnical-engineering report is unique, prepared *solely* for the client. *Those who rely on a geotechnical-engineering report prepared for a different client can be seriously misled*. No one except authorized client representatives should rely on this geotechnical-engineering report without first conferring with the geotechnical engineer who prepared it. *And no one – not even you – should apply this report for any purpose or project except the one originally contemplated.*

Read this Report in Full

Costly problems have occurred because those relying on a geotechnical-engineering report did not read it *in its entirety*. Do not rely on an executive summary. Do not read selected elements only. *Read this report in full.*

You Need to Inform Your Geotechnical Engineer about Change

Your geotechnical engineer considered unique, project-specific factors when designing the study behind this report and developing the confirmation-dependent recommendations the report conveys. A few typical factors include:

- the client's goals, objectives, budget, schedule, and risk-management preferences;
- the general nature of the structure involved, its size, configuration, and performance criteria;
- the structure's location and orientation on the site; and
- other planned or existing site improvements, such as retaining walls, access roads, parking lots, and underground utilities.

Typical changes that could erode the reliability of this report include those that affect:

- the site's size or shape;
- the function of the proposed structure, as when it's changed from a parking garage to an office building, or from a light-industrial plant to a refrigerated warehouse;
- the elevation, configuration, location, orientation, or weight of the proposed structure;
- the composition of the design team; or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project changes – even minor ones – and request an assessment of their impact. *The geotechnical engineer who prepared this report cannot accept responsibility or liability for problems that arise because the geotechnical engineer was not informed about developments the engineer otherwise would have considered.*

This Report May Not Be Reliable

Do not rely on this report if your geotechnical engineer prepared it:

- for a different client;
- for a different project;
- for a different site (that may or may not include all or a portion of the original site); or
- before important events occurred at the site or adjacent to it; e.g., man-made events like construction or environmental remediation, or natural events like floods, droughts, earthquakes, or groundwater fluctuations.

Note, too, that it could be unwise to rely on a geotechnical-engineering report whose reliability may have been affected by the passage of time, because of factors like changed subsurface conditions; new or modified codes, standards, or regulations; or new techniques or tools. *If your geotechnical engineer has not indicated an "apply-by" date on the report, ask what it should be*, and, in general, *if you are the least bit uncertain* about the continued reliability of this report, contact your geotechnical engineer before applying it. A minor amount of additional testing or analysis – if any is required at all – could prevent major problems.

Most of the "Findings" Related in This Report Are Professional Opinions

Before construction begins, geotechnical engineers explore a site's subsurface through various sampling and testing procedures. *Geotechnical engineers can observe actual subsurface conditions only at those specific locations where sampling and testing were performed*. The data derived from that sampling and testing were reviewed by your geotechnical engineer, who then applied professional judgment to form opinions about subsurface conditions throughout the site. Actual sitewide-subsurface conditions may differ – maybe significantly – from those indicated in this report. Confront that risk by retaining your geotechnical engineer to serve on the design team from project start to project finish, so the individual can provide informed guidance quickly, whenever needed.

This Report's Recommendations Are Confirmation-Dependent

The recommendations included in this report – including any options or alternatives – are confirmation-dependent. In other words, *they are not final*, because the geotechnical engineer who developed them relied heavily on judgment and opinion to do so. Your geotechnical engineer can finalize the recommendations *only after observing actual subsurface conditions* revealed during construction. If through observation your geotechnical engineer confirms that the conditions assumed to exist actually do exist, the recommendations can be relied upon, assuming no other changes have occurred. *The geotechnical engineer who prepared this report cannot assume responsibility or liability for confirmation-dependent recommendations if you fail to retain that engineer to perform construction observation.*

This Report Could Be Misinterpreted

Other design professionals' misinterpretation of geotechnical-engineering reports has resulted in costly problems. Confront that risk by having your geotechnical engineer serve as a full-time member of the design team, to:

- confer with other design-team members,
- help develop specifications,
- review pertinent elements of other design professionals' plans and specifications, and
- be on hand quickly whenever geotechnical-engineering guidance is needed.

You should also confront the risk of constructors misinterpreting this report. Do so by retaining your geotechnical engineer to participate in prebid and preconstruction conferences and to perform construction observation.

Give Constructors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can shift unanticipated-subsurface-conditions liability to constructors by limiting the information they provide for bid preparation. To help prevent the costly, contentious problems this practice has caused, include the complete geotechnical-engineering report, along with any attachments or appendices, with your contract documents, *but be certain to note conspicuously that you've included the material for informational purposes only*. To avoid misunderstanding, you may also want to note that "informational purposes" means constructors have no right to rely on the interpretations, opinions, conclusions, or recommendations in the report, but they may rely on the factual data relative to the specific times, locations, and depths/elevations referenced. Be certain that constructors know they may learn about specific project requirements, including options selected from the report, *only* from the design drawings and specifications. Remind constructors that they may perform their own studies if they want to, and *be sure to allow enough time* to permit them to do so. Only then might you be in a position to give constructors the information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions. Conducting prebid and preconstruction conferences can also be valuable in this respect.

Read Responsibility Provisions Closely

Some client representatives, design professionals, and constructors do not realize that geotechnical engineering is far less exact than other engineering disciplines. That lack of understanding has nurtured unrealistic expectations that have resulted in disappointments, delays, cost overruns, claims, and disputes. To confront that risk, geotechnical engineers commonly include explanatory provisions in their reports. Sometimes labeled "limitations," many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. *Read these provisions closely*. Ask questions. Your geotechnical engineer should respond fully and frankly.

Geoenvironmental Concerns Are Not Covered

The personnel, equipment, and techniques used to perform an environmental study – e.g., a "phase-one" or "phase-two" environmental site assessment – differ significantly from those used to perform a geotechnical-engineering study. For that reason, a geotechnical-engineering report does not usually relate any environmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated subsurface environmental problems have led to project failures*. If you have not yet obtained your own environmental information, ask your geotechnical consultant for risk-management guidance. As a general rule, *do not rely on an environmental report prepared for a different client, site, or project, or that is more than six months old.*

Obtain Professional Assistance to Deal with Moisture Infiltration and Mold

While your geotechnical engineer may have addressed groundwater, water infiltration, or similar issues in this report, none of the engineer's services were designed, conducted, or intended to prevent uncontrolled migration of moisture – including water vapor – from the soil through building slabs and walls and into the building interior, where it can cause mold growth and material-performance deficiencies. Accordingly, ***proper implementation of the geotechnical engineer's recommendations will not of itself be sufficient to prevent moisture infiltration.*** Confront the risk of moisture infiltration by including building-envelope or mold specialists on the design team. ***Geotechnical engineers are not building-envelope or mold specialists.***

- CPT Data Files (sent via email)

SUMMARY
OF
CONE PENETRATION TEST DATA

1. INTRODUCTION

This report presents the results of a Cone Penetration Test (CPT) program carried out for the Rexford Orange project located in Orange, California. The work was performed by Kehoe Testing & Engineering (KTE) on July 23, 2021. The scope of work was performed as directed by Leighton Consulting personnel.

2. SUMMARY OF FIELD WORK

The fieldwork consisted of performing CPT soundings at seven locations to determine the soil lithology. A summary is provided in **TABLE 2.1**.

LOCATION	DEPTH OF CPT (ft)	COMMENTS/NOTES:
CPT-1	30	Refusal
CPT-2	30	Refusal
CPT-3	29	Refusal
CPT-4	29	Refusal
CPT-5	28	Refusal
CPT-6	11	Refusal
CPT-6A	28	Refusal

TABLE 2.1 - Summary of CPT Soundings

3. FIELD EQUIPMENT & PROCEDURES

The CPT soundings were carried out by **KTE** using an integrated electronic cone system manufactured by Vertek. The CPT soundings were performed in accordance with ASTM standards (D5778). The cone penetrometers were pushed using a 30-ton CPT rig. The cone used during the program was a 15 cm^2 cone and recorded the following parameters at approximately 2.5 cm depth intervals:

- Cone Resistance (qc)
- Sleeve Friction (fs)
- Dynamic Pore Pressure (u)
- Inclination
- Penetration Speed

At locations CPT-3, CPT-4, CPT-5, CPT-6 & CPT-6A shear wave measurements were obtained at various depths. The shear wave is generated using an air-actuated hammer, which is located inside the front jack of the CPT rig. The cone has a triaxial geophone, which recorded the shear wave signal generated by the air hammer.

The above parameters were recorded and viewed in real time using a laptop computer. Data is stored at the KTE office for up to 2 years for future analysis and reference. A complete set of baseline readings was taken prior to each sounding to determine temperature shifts and any zero load offsets. Monitoring base line readings ensures that the cone electronics are operating properly.

4. CONE PENETRATION TEST DATA & INTERPRETATION

The Cone Penetration Test data is presented in graphical form in the attached Appendix. These plots were generated using the CPeT-IT program. Penetration depths are referenced to ground surface. The soil behavior type on the CPT plots is derived from the attached CPT SBT plot (Robertson, "Interpretation of Cone Penetration Test…", 2009) and presents major soil lithologic changes. The stratigraphic interpretation is based on relationships between cone resistance (qc), sleeve friction (fs), and penetration pore pressure (u). The friction ratio (Rf), which is sleeve friction divided by cone resistance, is a calculated parameter that is used along with cone resistance to infer soil behavior type. Generally, cohesive soils (clays) have high friction ratios, low cone resistance and generate excess pore water pressures. Cohesionless soils (sands) have lower friction ratios, high cone bearing and generate little (or negative) excess pore water pressures.

The CPT data files have also been provided. These files can be imported in CPeT-IT (software by GeoLogismiki) and other programs to calculate various geotechnical parameters.

It should be noted that it is not always possible to clearly identify a soil type based on qc, fs and u. In these situations, experience, judgement and an assessment of the pore pressure data should be used to infer the soil behavior type.

If you have any questions regarding this information, please do not hesitate to call our office at (714) 901-7270.

Sincerely,

KEHOE TESTING & ENGINEERING

Steven P. Kehoe
President

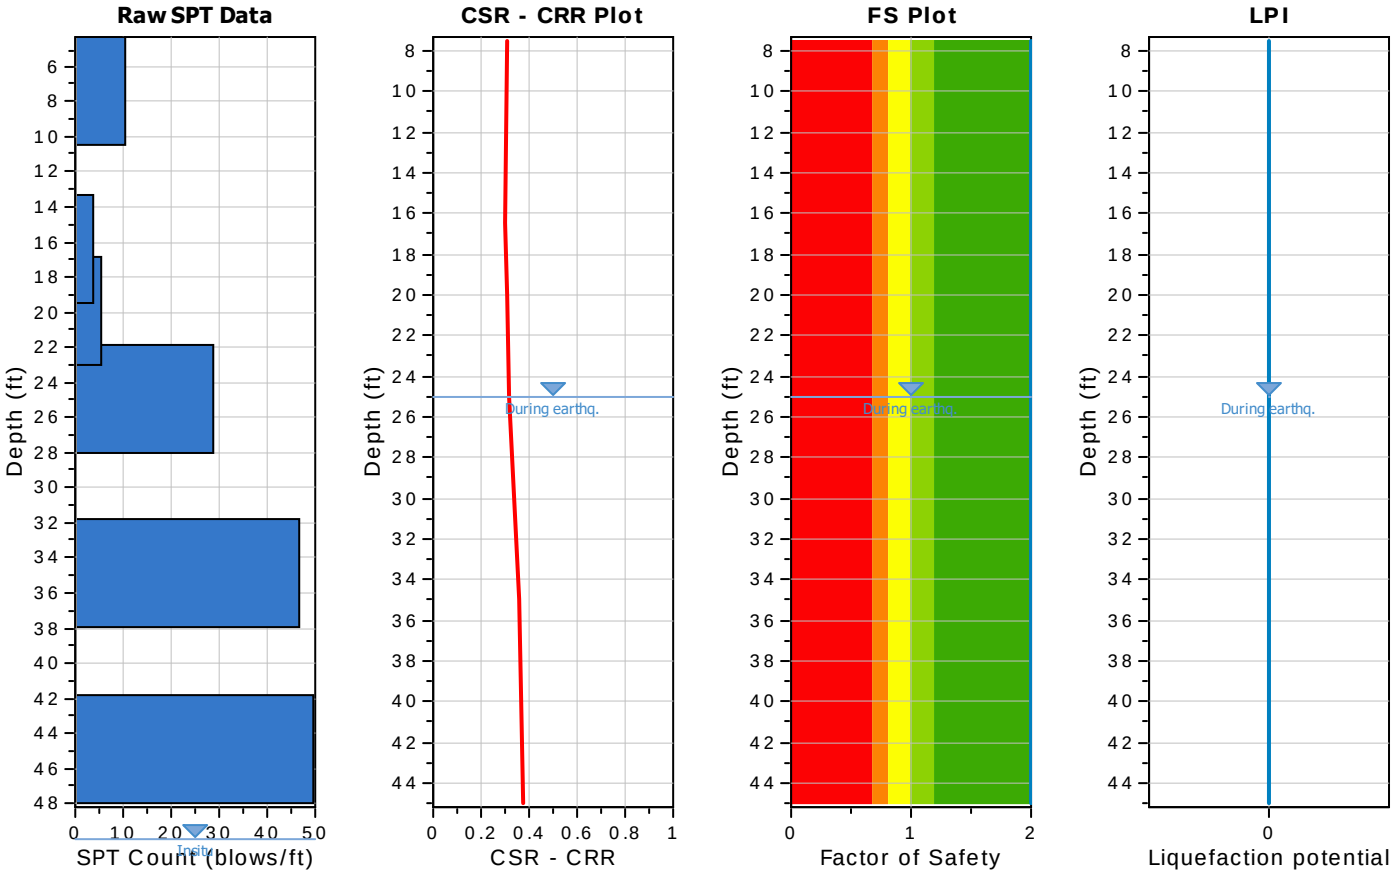
SPT BASED LIQUEFACTION ANALYSIS REPORT

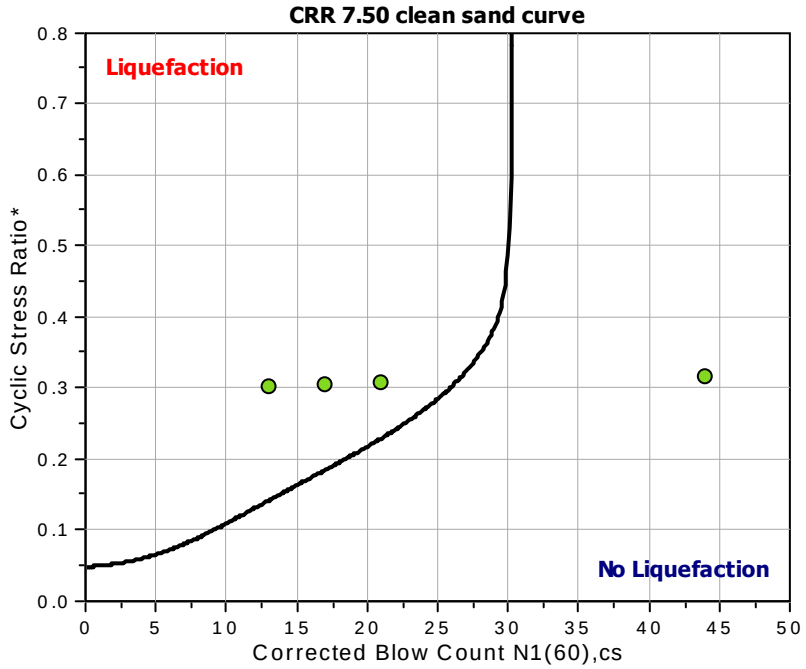
Project title : Rexford Orange **SPT Name: LB-2**

Location : 2390 American Way, Orange, CA

:: Input parameters and analysis properties ::

Analysis method:	NCEER 1998	G.W.T. (in-situ):	50.00 ft
Fines correction method:	NCEER 1998	G.W.T. (earthq.):	25.00 ft
Sampling method:	Sampler wo liners	Earthquake magnitude M_w:	6.50
Borehole diameter:	200mm	Peak ground acceleration:	0.69 g
Rod length:	3.30 ft	Eq. external load:	0.00 tsf
Hammer energy ratio:	1.33		





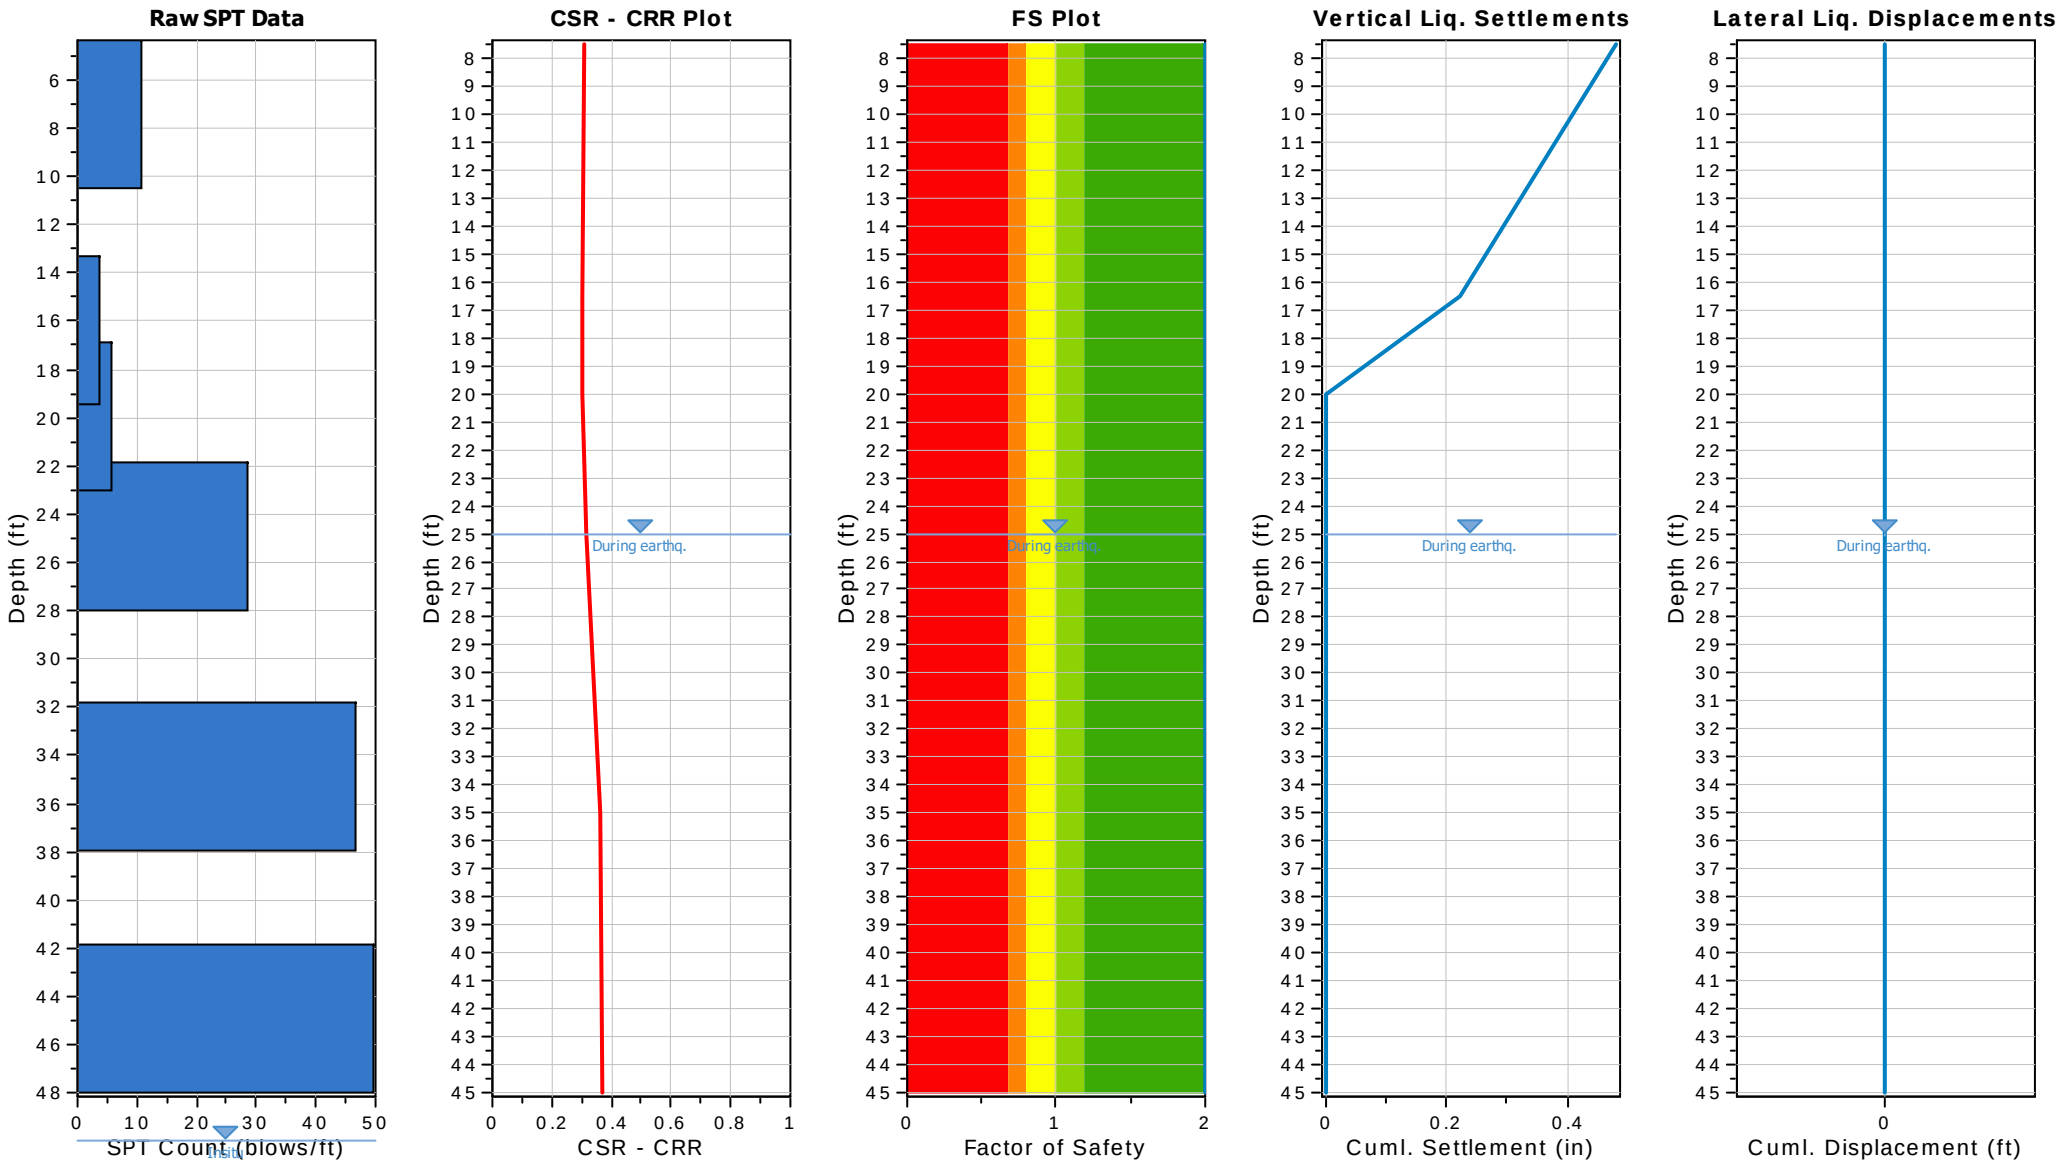
F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

:: Overall Liquefaction Assessment Analysis Plots ::



:: Field input data ::

Test Depth (ft)	SPT Field Value (blows)	Fines Content (%)	Unit Weight (pcf)	Infl. Thickness (ft)	Can Liquefy
7.50	11	10.00	120.00	15.50	Yes
16.50	4	70.00	120.00	3.50	Yes
20.00	6	90.00	120.00	5.00	No
25.00	29	10.00	120.00	5.00	Yes
35.00	47	10.00	120.00	10.00	Yes
45.00	50	10.00	120.00	10.00	Yes

Abbreviations

Depth: Depth at which test was performed (ft)
SPT Field Value: Number of blows per foot
Fines Content: Fines content at test depth (%)
Unit Weight: Unit weight at test depth (pcf)
Infl. Thickness: Thickness of the soil layer to be considered in settlements analysis (ft)
Can Liquefy: User defined switch for excluding/including test depth from the analysis procedure

:: Cyclic Resistance Ratio (CRR) calculation data ::

Abbreviations

σ_v: Total stress during SPT test (tsf)
u_o: Water pore pressure during SPT test (tsf)
σ'_{vo}: Effective overburden pressure during SPT test (tsf)
C_N: Overburden corretion factor
C_E: Energy correction factor
C_B: Borehole diameter correction factor
C_R: Rod length correction factor
C_S: Liner correction factor
$N_{1(60)}$: Corrected N_{SPT} to a 60% energy ratio
α, β: Clean sand equivalent clean sand formula coefficients
$N_{1(60)cs}$: Corected $N_{1(60)}$ value for fines content
$CRR_{7.5}$: Cyclic resistance ratio for M=7.5

Abbreviations

$\sigma_{v,eq}$: Total overburden pressure at test point, during earthquake (tsf)
$u_{o,eq}$: Water pressure at test point, during earthquake (tsf)
$\sigma'_{vo,eq}$: Effective overburden pressure, during earthquake (tsf)
r_d : Nonlinear shear mass factor
α: Improvement factor due to stone columns
CSR : Cyclic Stress Ratio (adjusted for improvement)
MSF : Magnitude Scaling Factor
$CSR_{eq,M=7.5}$: CSR adjusted for M=7.5
K_{sigma}: Effective overburden stress factor
CSR^*: CSR fully adjusted (user FS applied)***
FS: Calculated factor of safety against soil liquefaction

*** User FS: 1.00

Worksheet H: Factor of Safety and Design Infiltration Rate and Worksheet

Factor Category		Factor Description	Assigned Weight (w)	Factor Value (v)	Product (p) p = w x v
A	Suitability Assessment	Soil assessment methods	0.25	2	0.5
		Predominant soil texture	0.25	1	0.25
		Site soil variability	0.25	2	0.5
		Depth to groundwater / impervious layer	0.25	2	0.5
		Suitability Assessment Safety Factor, $S_A = \Sigma p$			1.75
B	Design	Tributary area size	0.25		
		Level of pretreatment/ expected sediment loads	0.25		
		Redundancy	0.25		
		Compaction during construction	0.25		
		Design Safety Factor, $S_B = \Sigma p$			
Combined Safety Factor, $S_{Total} = S_A \times S_B$					
Observed Infiltration Rate, inch/hr, $K_{observed}$ (corrected for test-specific bias)					
Design Infiltration Rate, in/hr, $K_{DESIGN} = K_{Observed} / S_{Total}$					
Supporting Data					
Briefly describe infiltration test and provide reference to test forms:					

Note: The minimum combined adjustment factor shall not be less than 2.0 and the maximum combined adjustment factor shall not exceed 9.0.

1 EXECUTIVE SUMMARY

ADR Environmental Group, Inc. (ADR) was engaged by Rexford Industrial Realty, L. P., to perform a Phase I Environmental Site Assessment (ESA) for the site located at 2390-2444 North American Way in Orange, California (subject Property).

This ESA was performed in conformance with the scope and limitations of ASTM International (ASTM) Standard Practice E 1527-13, the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (AAI) (40 CFR Part 312), and the scope of services identified in the July 30, 2014, Master Environmental Consulting Services Agreement between Rexford Industrial Realty, L. P. and ADR (the "MSA"). This ESA has identified no evidence of *recognized environmental conditions* (RECs) as defined by ASTM in connection with the subject Property. As a result, no further investigation is recommended.

However, the following business environmental risk was identified:

- In 1971, the City of Orange issued a building permit for the installation of a 550-gallon gasoline storage tank at 560 W. Fletcher Avenue, a historical address associated with the subject Property. The permit did not indicate whether the tank was actually installed or whether the permit pertained to an aboveground storage tank (AST) or underground storage tank (UST). In addition, no record of a tank removal/abandonment was located. Lastly, no evidence of a storage tank (AST or UST) was observed during the site inspection or during ADR's historical aerial photograph review. Based on this building permit, it is possible that a small gasoline UST remains on the subject Property. However, based on the small capacity of the referenced tank, the depth to groundwater, which exceeds 130 feet, and the lack of evidence of a release, if a UST was installed, it is unlikely that the tank would have significantly impacted the subject Property (e.g., impacted groundwater). Regardless, if a UST is encountered during future redevelopment activities at the subject Property, ADR recommends a licensed contractor abandon the tank in accordance with all applicable regulations.

In addition, the following *de minimis* issue was identified:

- Minor staining of concrete pads, soil and gravel was observed in various areas in the leased storage yards. Staining can be an indication of poor hazardous materials handling. Based on the size of the stains and materials observed onsite during the site inspection (e.g., hydraulic fluid, latex paints, etc.) it is unlikely that this staining represents an environmental concern. With the exception of better handling practices, including storing materials in secondary containment and collecting and disposing of any spilled material promptly, ADR recommends no additional action or investigation regarding the observed staining.

2 INTRODUCTION

2.1 Purpose

The purpose of this ESA is to identify recognized environmental conditions in connection with the subject Property. The term *recognized environmental conditions*, as defined in *ASTM Standard Practice for Environmental Assessments: Phase I Environmental Site Assessment Process (*ASTM Standard Practice E 1527-13), means the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. The term is not intended to include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be *de minimis* are not recognized environmental conditions.

In addition, this ESA will identify *historical recognized environmental conditions, controlled recognized environmental conditions* and *business environmental risks.* A *historical recognized environmental condition* is defined as a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. A *controlled recognized environmental condition* is defined as a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls. A *business environmental risk* is a risk which can have a material environmental or environmentally driven impact on the business associated with the current or planned use of a parcel of commercial real estate but is not considered a *recognized environmental condition.*

This ESA was performed in a manner that complies with the Scope and Limitations of the ASTM Standard Practice E 1527-13, AAI (40 CFR Part 312) and ADR's contractual obligations to the Client, identified in the Master Environmental Consulting Services Agreement (MSA) dated July 30, 2014.

The procedure for this ESA was to perform in practical and reasonable steps an investigation to ascertain the possibility, presence, or absence of recognized environmental conditions as delineated by the Scope of Work. This was accomplished by employing currently available technology, existing regulations, and generally acceptable engineering practices.

2.2 Significant Assumptions

The following assumptions are made by ADR in this report. ADR relied on information derived from secondary sources including government agencies, the client, designated representatives of the client, property contacts, property owner, property owner's representatives, computer databases, and/or personal interviews. Although ADR has evaluated the thoroughness and reliability of the provided information (consistent with the requirements of 40 CFR 312.20(f)(2)), ADR can neither warrant nor guarantee the

thoroughness and reliability of information derived from secondary sources including the government agencies, the client, designated representatives of the client, property contacts, property owner, property owner's representatives, computer databases, and/or personal interviews. Groundwater flow and depth to groundwater, unless otherwise specified by on-property well data or off-site subsurface investigations, are assumed based on contours depicted on the United States Geological Survey topographic maps. ADR assumes the subject Property has been correctly and accurately identified by the client, designated representative of the client, property contact, property owner, and/or property owner's representative.

2.3 Limitations and Exceptions

The findings and conclusions contain all of the limitations inherent in the methodologies referred to in ASTM Standard Practice E 1527-13 that are intended to reduce, but not eliminate, uncertainty regarding the potential for recognized environmental conditions in connection with a property. Other specific limitations and exceptions (also known as Data Gaps) to the ESA are more specifically set forth below:

- The owner or owner's representative was not available to be interviewed for this ESA and the Environmental Site Assessment Questionnaire was not completed.
- The ADR Assessor was not provided access to the two residences, garage and several areas in the subject Property commercial building including the upper floor and stairway, and other unknown spaces – the doors were locked and no key(s) was available.

ADR believes that the Data Gaps identified above are not significant and are unlikely to affect the conclusions and recommendations of this report.

2.4 Scope of Work

The scope of work for this ESA is in accordance with the requirements of ASTM Standard Practice E 1527-13, AAI and the MSA. ADR warrants that the findings and conclusions contained herein were accomplished in accordance with the methodologies set forth in the Scope of Work. These methodologies are described as representing good commercial and customary practice for conducting an Environmental Site Assessment of a property for the purpose of identifying recognized environmental conditions.

2.5 Environmental Assessment Report Special Terms and Conditions

This ESA was performed in accordance with the Scope of Services set forth in the contract document. No other warranty or guarantee, expressed or implied, is made or offered.

The conclusions and recommendations (if applicable) stated in this ESA are based upon observations made by employees of ADR and upon information obtained by ADR. While reasonable attempts have been made to verify this information, we cannot guarantee its accuracy.

The observations contained within this ESA are based upon site conditions readily visible and present at the time of our site inspection. These site observations are unable to specifically address conditions of subsurface soil, groundwater, or underground storage tanks, if applicable, unless specifically mentioned.

In the event of any conflict between the terms and conditions of this report and the terms and conditions of the MSA, the MSA shall control.

2.6 User Reliance

The enclosed ESA has been performed for the exclusive use of Rexford Industrial Realty, L.P., and/or its subsidiaries, as their interests may appear, for the transaction at issue concerning the subject Property located at 2390-2444 North American Way in Orange, California.

2.7 General Information

No "Key Site Manager" was identified. The Key Site Manager is that person having the most reliable knowledge as to the previous uses and current conditions of the subject Property, and in a position to provide reasonably accurate information for the Environmental Site Assessment Questionnaire (Questionnaire). A copy of the blank Questionnaire is included in the appendix.

Mr. Steven Kerchner, Environmental Assessor with ADR, conducted the on-site inspection on July 2, 2021. Mr. Tom Narbutas and Mr. Ryan Leslie with Rexford Industrial Realty, L. P. and Ms. Teresa Gorman with Fiduciary Real Estate Services (FRES) accompanied the ADR Assessor during the site visit. Weather conditions for the site inspection consisted of clear skies with temperatures in the 70s.

The following individuals were interviewed to obtain information relevant to the historical development and/or issues associated with possible recognized environmental conditions associated with the subject Property.

Name	Title or Position/Employer
Ms. Teresa Gorman	Broker/FRES
Mr. Tomas Narbutas	Senior Analyst, Acquisitions/Rexford Industrial Realty, L. P.
Mr. Patrick Schlehuber	Executive Vice President, Investments/Rexford Industrial Realty, L. P.
Mr. Ryan Leslie	Acquisitions/Rexford Industrial Realty, L. P.
Ms. Barbara Reid	City Clerk/City of Orange, Fire and Building Departments
Ms. Jone Barrio	Regional Records Coordinator/Department of Toxic Substances Control
Name not provided	File Review Desk/Regional Water Quality Control Board-Santa Ana Region
Ms. Lisa Ramos	Public Records Coordinator/South Coast Air Quality Management District
Ms. Liz Rodriguez	Records/Orange County Health Care Agency
Ms. Tina Knapp	Assistant Clerk of the Board/Orange County Sanitation District
Ms. Iris Vicent	Management Assistant/Orange County Fire Authority

3 USER PROVIDED INFORMATION

Mr. Patrick Schlehuber, Executive Vice President, Investments, with Rexford Industrial Realty, L. P., was identified as the best candidate to complete the User Questionnaire. The User Questionnaire consists of inquiries as to specific knowledge regarding the purchase of a site as specified by ASTM Standard Practice E 1527-13. This knowledge consists of environmental liens against the subject Property, purchase price, limitations at a site, and spills. A copy of this Questionnaire is included in the appendix.

3.1 Title Records

A copy of an April 5, 2021, "ALTA Commitment for Title Insurance" prepared by the First American Title Company was provided to ADR. A review of this document did not identify any environmental issues. A copy of this document is included in the appendix.

3.2 Environmental Liens or Activity and Use Limitations (AUL)

Mr. Schlehuber is unaware of any environmental liens or AULs such as engineering controls, land use restrictions, or institutional controls associated with the subject Property.

3.3 Specialized Knowledge

Mr. Schlehuber has no specialized knowledge of the operations associated with the subject Property.

3.4 Commonly Known or Reasonably Ascertainable Information

Mr. Schlehuber is unaware of any commonly known or reasonably ascertainable information of any environmental issues associated with the subject Property.

3.5 Valuation Reduction for Environmental Issues

Mr. Schlehuber indicated that the market value of the subject Property has not been reduced due to any environmental issues.

3.6 Owner, Property Manager, and Occupant Information

The following information regarding the Owner and Occupants was provided by the User, Key Site Manager, and onsite tenants.

Property Owner:	Richard Huntington, Conservator of the Estate of Marty S. Adair
Property Manager:	None identified
Occupants:	Refer to section 4.5

3.7 Reason for Performing ESA

The purpose of this Phase I Environmental Site Assessment (ESA) was to identify existing or potential Recognized Environmental Conditions (as defined by ASTM Standard Practice E-1527-13) in connection with the subject Property. This ESA was also performed to permit the *User* to satisfy one of the requirements to qualify for the *innocent landowner*, *contiguous property owner*, or *bona fide prospective purchaser* limitations on scope of Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. §9601) liability (hereinafter, the "*landowner liability protections*," or "*LLPs*"). ASTM Standard Practice E-1527-13 constitutes "*all appropriate inquiries"* into the previous ownership and uses of the *property"* consistent with good commercial or customary practice" as defined at 42 U.S.C. §9601(35) (B).

ADR understands that the findings of this study will be used by Rexford Industrial Realty, L.P. to evaluate a pending financial transaction in connection with the subject Property.

4 GENERAL SITE CHARACTERISTICS

4.1 Location and Legal Description

The subject Property is located at the following addresses: 2390-2444 North American Way in Orange, California, and its location is shown on maps included in the appendix of this ESA. In addition, an aerial site plan of the subject Property is included in the appendix.

For further geographic reference, the subject Property is located at the southwest corner of the intersection of North American Way and West Fletcher Avenue as identified on the Orange County Assessor's Parcel Map. A copy of this map is included in the appendix of this ESA.

Legal Description:

A copy of the legal description is contained in the appendix.

4.2 Site and Vicinity Characteristics

The subject Property is located in a light-industrial, commercial, and residential area of Orange. Industrial/commercial businesses are located to the south and east. Residential structures are located to the north across West Fletcher Avenue. A stormwater detention pond is immediately west of the subject property and is followed by additional industrial/commercial development. No gasoline service stations, dry cleaners, major manufacturing or heavy industrial facilities were located in the immediate vicinity of the site. No pits, other ponds, dry wells, lagoons, swales or wetlands were observed on the subject Property or in the general vicinity.

4.3 Site Description and Current Site Uses/Operations

At the time of the site inspection, the subject Property consisted of a nearly rectangular-shaped parcel of land totaling approximately 4 acres developed with an approximately 20,000 square foot (estimated) single-story with penthouse commercial building (2390 North American Way), two residential structures (2442 and 2444 North American Way) that total approximately 4,300 square feet, an approximately 1,500 square foot gazebo, a garage and two open sheds. At the time of the site inspection, the commercial building located on the subject Property was a cultural center, individuals occupied the residences, a pallet manufacturer occupied the two open sheds, and several different businesses leased unimproved areas to store vehicles, materials and equipment. The remaining portions of the subject Property consisted of asphalt- and concrete-paved storage areas, parking areas and drives, gravel-covered areas, areas of exposed soil, and modest landscaped areas. Vehicle access onto the subject Property is provided by one driveway off West Freedom Avenue to the south, two drives off North American Way to the east, and one off West Fletcher Avenue to the north. The subject Property appeared to be in good condition and well-maintained.

4.3.1 Surface Characteristics

The subject Property consists of approximately 80 percent relatively impermeable surfaces including the buildings, garage and the asphalt- and concrete-paved areas. The remaining portion of the subject Property's surface consists of landscaped areas, gravel-

covered areas and exposed soil. No significant surface staining was observed on the subject Property during the site inspection. The overall topography of the subject Property appears to slope to the southwest.

4.3.2 Structure Construction

The single-story with penthouse U-shaped commercial building consisted of tilt-up concrete panels with wood furring. The exterior walls are primarily wood with some stucco. Tenant spaces facing a courtyard have facades finished with masonry, wood and other materials. The ground floor is concrete slab-on-grade. The flat roof is covered with built-up roofing and is concealed by a parapet wall that slopes to form a colonnade and the sloped portion is covered with clay tile. Interior partitions are framed and covered with wood paneling/wainscot, porcelain tile and textured gypsum board. Ceilings are wood paneling, decorative ceiling tile, and finished gypsum board. Floor coverings consist of wood parquet tile, ceramic tile, sheet vinyl and carpet. Lighting is provided by fluorescent fixtures.

The single-story residences are wood-framed with stucco exterior walls. The gable roofs are covered with composition roofing. The floors are concrete slab-on-grade. The interiors were not accessible; therefore, the interior finishes could not be determined.

The gazebo is wood-framed with clay tile roofing. The open sheds are wood-framed.

4.3.3 Interior Configuration

The cultural center building consists of office areas, ballrooms, kitchen, dining rooms, conference room, retail areas, hallways, restrooms and lobbies.

The residences likely consist of living room, kitchen, dining area, bedrooms, restrooms and hallway(s). The garage was not accessible and it is not known what is stored inside that building.

4.3.4 Potable Water Supply, Sewer, and Other Utilities

At the time of the site inspection, the City of Orange provided potable water and sanitary sewer service to the subject Property. Southern California Edison (SCE) provides electrical power to the subject Property and Southern California Gas Company provides natural gas service to the subject Property for heating. During the course of the on-site inspection, no evidence of active or abandoned water supply wells was observed. No septic systems were observed on the subject Property.

According to previous environmental assessments (refer to Section 8.3), the residential structures at 2442 and 2444 North American Way formerly utilized an on-site septic system for the treatment and disposal of domestic waste. The septic system was destroyed and backfilled in 1992. Based on the expected use of the system for domestic waste, the presence of the former septic system is unlikely to represent an environmental concern.

Since the subject Property is serviced by a municipally operated, public water system, it is regulated by the Safe Drinking Water Act of 1974. This Act requires that public water supplies be tested for the presence of various metals, microbiological bacteria and organic chemicals. Information supplied by the City of Orange Water Division states

that the water quality delivered to the subject Property complies with applicable regulatory requirements and the water is routinely tested.

4.4 Environmental Liens

A specific search for environmental liens and activity and use limitations was not included in the scope of work for this ESA. However, based on information obtained from the User and the Environmental Data Resources (EDR) Radius Map Report, ADR identified no evidence of environmental liens recorded against the subject Property. In addition, according to the EDR-provided information for the subject Property, no institutional controls, land use restrictions and/or engineering control requirements recorded against the subject Property was reported.

4.5 Current Site Uses

According to information from the City of Orange Planning Department, the subject Property is zoned for light manufacturing (M-1) usage. At the time of the site inspection, the subject Property was occupied by the following entities.

Name	Address/Location	Description
American Way Cultural Center	2390 N. American Way	Event center
Adan Tree Specialist	Storage yard	Arborist
A-1 Septic Pumping	2390 N. American Way	Vehicle storage
D&N Sealing & Restriping	Storage yard	Asphalt maintenance
Duarte Ramos Recycling	Storage yard	Metal recycling
Frank & Sons Enterprises	Storage yard	Unknown
Gregorios Pallets aka Heavy Duty Pallets	Storage yard	Pallet manufacturer
Orange Pool Plastering	Storage yard	Swim pool contractor
Residence	2442 N. American Way	Residence
Residence	2444 N. American Way	Residence

4.6 Physical Setting Sources

The subject Property's physical location was researched employing the current United States Geological Survey (USGS) 7.5 Minute Topographic Quadrangle (Quad Map) section relevant to the subject Property. The Quad Map has an approximate scale of 1 inch to 2,000 feet, and shows physical features such as wetlands, water bodies, roadways, mines, and buildings. A portion of this map showing the subject Property is included in the appendix of this ESA.

The Orange, CA (dated 1981) and Anaheim, CA (dated 1981) Quad Maps show the following pertinent features: a structure similar to one of the present-day residential structures (2442 and 2444 North American Way) is identified on the northeast portion the subject Property; the remaining portion of the subject Property is structurally undeveloped; the present-day roadway system is identified; the Fletcher Retarding Basin [detention pond] is to the immediate west; residential-type structures are identified on the westernmost north and northernmost east adjoining properties; the south and southernmost east adjoining properties are structurally undeveloped land; an intermittent canal is to the north across West Fletcher Avenue; a structure similar to the present-day school building is to the northeast; a water well is approximately 1,000 feet west; a railroad right-of-way is approximately 1,200 feet southeast; the Santa Ana River is approximately 2,000 feet west; and a scarified area partially identified as "Sandpit" is approximately 2,100 feet north.

There are no mines, oil wells, other water wells, wetlands, pipelines or other environmentally sensitive features present in the general vicinity of the subject Property. The elevation of the subject Property is approximately 190 feet above mean sea level with a topographic gradient to the southwest.

4.6.1 Soil Conditions

According to information provided by the United States Department of Agriculture (USDA) Soil Conservation Service (SCS), the soil underlying the subject Property is identified as Metz loamy sand. The Metz series consists of very deep, somewhat excessively drained soils that formed in alluvial material from mixed, but dominantly sedimentary rocks. Metz soils are on floodplains and alluvial fans. In a typical profile, the upper is 12 inches is a light brownish gray to dark grayish brown fine sandy loam. From 12 to 29 inches is a light brownish gray to dark grayish brown fine sand. From 29 to 38 inches is a light brownish gray to grayish brown sand. From 38 to 52 inches is a light brownish gray to olive brown very fine sandy loam. From 52 to 118 inches is a light brownish gray to dark grayish brown fine sand.

It should be noted that the characterization previously described is merely a generalization extrapolated from available soil data. In actuality, a portion of the subsurface soils of the subject Property have likely been modified by cuts for the building foundation and underground utilities.

4.6.2 Geologic Conditions

According to the 1999 Preliminary Digital Geologic Map of the Santa Ana 30' x 60' Quadrangle, Southern California, Version 1.0 the subject Property is located within the northern part of the Peninsular Ranges Province, which is underlain by basement rocks of the Transverse Ranges Province. The subject Property is located within an area comprised of young alluvial fan deposits, Holocene and late Pleistocene. Unconsolidated deposits of alluvial fans and headward drainages of fans consists predominately of gravel, sand, and silt. Trunk drainages and proximal parts of fans contain higher percentages of coarse-grained sediment than distal parts.

4.6.3 Groundwater Conditions

No site-specific groundwater information for the subject Property was obtained. However, according to a December 11, 2002, "Case Closure Summary" document obtained from the State Water Resources Control Board's (SWRCB) *GeoTracker* website prepared for the Hamilton Materials facility located at 345 Meats Avenue (approximately 2,000 feet southeast of the subject Property), groundwater at that site was estimated at 130 below ground surface (bgs). Based on topography, groundwater flow direction is assumed to be south. A copy of the referenced closure document is included in the appendix.

It should be noted that estimated groundwater levels may vary due to fluctuations in precipitation, local usage demands, geology, underground structures, or dewatering operations.

5 HISTORICAL USE INFORMATION

From a review of available historical information, it can be concluded that by 1938 the subject Property was structurally undeveloped agricultural (orchard) land. Between 1938 and 1946, the orchard was removed and the subject Property was fallow. Between 1946 and 1952, the subject Property was developed with one of the residences observed during the site inspection and several smaller structures that appear to have been greenhouses and sheds on the eastern portion of the subject Property. Between 1952 and 1956, the subject Property was developed with the second residence observed during the site inspection and more agricultural outbuildings. Between 1972 and 1977, the agricultural outbuildings previously located on the east side of the subject Property were removed. In 1979/1980, the cultural center was constructed on the southern portion of the subject Property. By 1989, the central and northwestern portions of the subject Property were used for material and equipment storage and the subject Property was similar to its appearance during the site inspection. Since its initial development, the subject Property has been occupied by individuals, roofing contractor, health club, asphalt resealing and restriping firm, metal recycler, wood pallet manufacturer, arborist, landscape contractor, swim pool contractor and cultural center.

Between 1946 and 1952, the westernmost north adjoining property was developed with a residence that was removed sometime between 1977 and 1985; between 1963 and 1966, the easternmost north adjoining property was developed with the elementary school observed during the site inspection; and. between 1977 and 1985, the condominiums and townhouses observed on the north adjoining property were constructed. Between 1985 and 1989, the south adjoining property across West Freedom Avenue was developed with the business park observed during the site inspection. Between 1946 and 1952, the east adjoining property was developed with a residence that was removed sometime between 1963 and 1966; from sometime between 1952 and 1963 until sometime between 1977 and 1985, the east adjoining property was used for equipment/materials storage; and, between 1977 and 1985, was developed with the facility observed during the site inspection. Between 1938 and 1946, the west adjoining property was used as a borrow pit and, between 1952 and 1963, was converted to a stormwater detention pond.

5.1 Aerial Photographs

Aerial photographs were reviewed to determine information on past land use patterns of the subject Property. These photographs date back to 1938 and were supplied by EDR Aerial Photography. From this search, the following information was gathered:

1938: The subject Property is structurally undeveloped agricultural land (orchard). A light-duty roadway (West Fletcher Avenue) is visible along the northern boundary. The adjoining properties are structurally undeveloped agricultural land (orchard). Residential structures are visible to the northeast and west.

1946: The previously identified orchard has been removed and the subject Property is vacant. The north and east adjoining properties are structurally undeveloped agricultural land (orchard). The south adjoining property is structurally undeveloped vacant land. The west adjoining property appears to be a soil borrow pit.

1952: The easternmost residential structure similar to that observed during the site inspection is visible on the northeast portion of the subject Property. Several

smaller structures and agricultural structures or greenhouses are visible to the south of the residence. The remaining portion of the subject Property is structurally undeveloped agricultural land. The adjoining and neighboring properties are similar to that observed in the 1946 aerial photograph with the exception that what appears to be a residence is visible on the westernmost north adjoining property across West Fletcher Avenue, what appears to be a residence is visible on the east adjoining property across North American Way, the orchard previously located on the north adjoining property has been removed, and there is moderately more structural development in the general area.

1963: The westernmost residential structure observed during the site inspection is visible on the northeast portion of the subject Property. Additional agricultural-type structures or greenhouses are visible to the south of these residential structures. The remaining portion of the subject Property is structurally undeveloped. The adjoining and neighboring properties are similar to that observed in the 1952 aerial photograph with the exception that the orchard has been removed from the east adjoining property and the area is partially used for storage, additional residential development is visible to the north, and the west adjoining parcel is used as a stormwater detention pond. Residential development is visible to the northeast and south.

1966: The subject Property and adjoining and neighboring properties are similar to their appearances in the 1963 aerial photograph with the exception that the present-day Fletcher Elementary School is visible on the eastmost north adjoining property across West Fletcher Avenue, the residence previously located on the east adjoining property is no longer visible, and there is moderately more structural development in the general area.

1972: The previously identified agricultural structures or greenhouses along the eastern side of the subject Property have been removed. The two residential structures remain on the northeast portion of the subject Property. The remainder of the subject Property is structurally undeveloped. The adjoining and neighboring properties are similar to that observed in the 1966 aerial photograph with the exception that the east adjoining property is used as an exterior storage yard and there is moderately more structural development in the general area.

1977: The subject Property and adjoining and neighboring properties are similar to that observed in the 1972 aerial photograph.

1985: The structure similar to the present-day commercial structure (2390 North American Way) is visible on the southern portion of the subject Property. The remaining portion of the subject Property is similar to its appearance on the 1977 aerial photograph. Light-duty roadways are visible to the south (West Freedom Avenue) and east (North American Way). The residence previously located on the westernmost north adjoining property is no longer visible and the north adjoining property has been developed with the condominiums and townhomes observed during the site inspection. The east adjoining property has been developed with the light-industrial building observed during the site inspection. The south and west adjoining properties are similar to their appearances on the 1977 aerial photograph.

1989: The center and northwest portions of the subject Property are used as an exterior storage yard. The area south of the present-day residential structures has been

developed with the present-day parking area. The adjoining and neighboring properties are similar to that observed in the 1985 aerial photograph with the exception that the southern adjoining property has been developed with the present-day light-industrial structures.

1990: The subject Property and adjoining and neighboring properties are similar to that observed in the 1989 aerial photograph.

2005: The remainder of the subject Property and adjoining and neighboring properties are similar to that observed in the 1990 aerial photograph.

2009: The subject Property and adjoining and neighboring properties are similar to that observed in the 2005 aerial photograph.

2012: The subject Property and adjoining and neighboring properties are similar to that observed in the 2009 aerial photograph.

2016: The subject Property and adjoining and neighboring properties are similar to that observed in the 2012 aerial photograph.

5.2 Building Permits

In an attempt to determine the prior uses and date of initial development of the subject Property, the ADR Assessor reviewed permit information obtained from the City of Orange by others. Current and historical addresses searched included 2372-2390 North American Way and 540, 560, 610 and 612 West Fletcher Street. From this search, the following pertinent information was obtained:

Date	Permit No.	Issued To	Description
560 West Fletcher Avenue:			
3/1/1971	36580	Richard Adair	Construct new 20' by 30' "industrial offices"
3/1/1971	30075	Richard Adair	Install a septic tank
4/13/1971	36808	Adair Roofing	Install 550-gallon gasoline storage tank
2390-2444 North American Way:			
?/?/1979	53859	Joe Adair	Construct a 1-story concrete tilt-up building totaling 17,000 SF at 2372-2398 N. American Way for use as offices, health club and theater/restaurant
10/6/1980	59733	Richard Adair	Tenant improvement to 6,500 SF of a concrete tilt-up building for offices, restaurant and health club
11/30/1981	61523	Richard Adair	Installation of two spas

It is not known whether the gasoline storage tank was an aboveground or underground tank or whether the work was done and the tank installed. Further, no record of a tank removal or abandonment was located.

In addition to the above listed permits, tenant improvement, electrical, sewer, plumbing, swim pool (none observed) and heating and air conditioning permits were reviewed; however, these permits did not contain information regarding potential environmental impacts to the subject Property. The above listed permits are the oldest and/or most relevant to this report. No permits pertaining to structural demolition or oil/water separators were located. However, a January 16, 2020, "Notice of Violation and Order to Comply" issued by the City of Orange indicated that an inspection identified several conditions that violate the Orange Municipal Code including unfinished stairs, exposed

wiring, illegal balcony and several other deficiencies. Copies of the listed permits and notice are included in the appendix.

5.3 Fire Insurance Information

The ADR Assessor attempted to review Sanborn Maps for the area of the subject Property. Sanborn Maps are detailed drawings that show the location and use of structures on a given property during specific years. These maps were originally utilized by insurance companies to assess fire risk but are now utilized as a valuable source of historical and environmental risk information. However, no Sanborn Maps were available that covered the subject Property. A copy of the "Certified Sanborn Map Report" provided by EDR indicating that the subject Property is an "unmapped property" is included in the appendix.

5.4 City Street Directories

To determine the prior uses and occupants of the subject Property, the ADR Assessor reviewed city directory information provided by EDR which is compiled in *The EDR-City Directory Abstract*. City street directories list property occupants by address, allowing an historical search of tenants on the subject Property and neighboring properties. Selected directories from the years between 1920 and 2014 (in approximate 5-year intervals) were researched and identified the following information:

Address	Year	Listing
2374 North American Way (subject Property address)	1920 – 1979 1980 1980 - 2015	Address not listed Adair Enterprises Address not listed
2390 North American Way (subject Property address)	1920 – 1979 1980 1986 -1991 1994 1995 1999 2004 2009 2014	Address not listed Jouwy C doe TLA Enterprise, American Way Cultural Center, Adair Roofing Inc., American, Adair Glenda Adair Enterprises, Adair Roofing Inc. American Way Cultural Center, Adair Enterprises Adair Enterprises, Adair Roofing Incorporated, American Way Cultural Center American Way Cultural Center, Inc., Richard Adair Adair Roofing Inc., American Way Cultural Center Adair Enterprises, Adair Roofing Inc., American Way Cultural Center
2442 North American Way (subject Property)	1920 – 1998 1999 - 2014	Address not listed Richard Adair
2444 North American Way (subject Property)	1920 – 2008 2008 - 2014	Address not listed Occupant unknown
540 West Fletcher Street (subject Property)	1920 – 1969 1970 1971 - 2014	Address not listed Adair Roofing Inc. Address not listed
560 West Fletcher Street (subject Property)	1920 – 1974 1975 1980 1981 - 2014	Address not listed Adair Roofing Inc. Capital Lumber Co. Address not listed
610 West Fletcher Street (subject Property)	1920 – 1974 1975 1980 – 1986 1987 - 2003 2004 2005 - 2014	Address not listed Huntzinger Hugo H. Nuntzinger Hugo H., Mains Donald Address not listed Occupant unknown Address not listed

Address	Year	Listing
612 West Fletcher Street (subject Property)	1920 – 1974 1975 1980 1981 - 2014	Address not listed McClellan Mark Newcomb S. Address not listed

A copy of *The EDR-City Directory Abstract* is contained in the appendix.

5.5 Interviews

No person with sufficient knowledge of the current and prior usage of the subject Property was identified.

5.6 Assessors Tax Records

To determine the prior uses of the subject Property, the ADR Assessor obtained available public records from the Orange County Assessor's Office (OCAO) assessor portal. Tax assessment records typically identify adjustments in property tax, which possibly indicate property development, or contain records of building permits or other useful information regarding a property. However, the OCAO assessor portal does not provide property information.

5.7 Recorded Land Title Records

Recorded land titles are records usually maintained by the municipal clerk or county recorder of deeds which detail ownership fees, leases, land contracts, easements, liens, deficiencies, and other encumbrances attached to or recorded against the subject Property in the local jurisdiction having control for or reporting responsibility to the subject Property. Due to state land trust regulations and laws, land title records will often only provide trust names, bank trust numbers, owner's names, or easement holders, and not information concerning previous uses or occupants of the subject Property. For these reasons, this ESA has relied upon other standard historical information sources assumed to be either more accurate or informative than recorded land titles.

6 INFORMATION FROM SITE RECONNAISSANCE AND INTERVIEWS

6.1 Hazardous Materials Handling and Storage

At the time of the site inspection, at least five 55-gallon drums and several 5-gallon pails of hydraulic fluid, several 5-gallon pails of latex paint and asphalt emulsion, and various lubricants and spray paint cans were observed at various locations throughout the storage yards. These materials were stored in sealed containers that were supplied by the manufacturers. An inspection of the subject Property commercial building revealed no signs of spills or unauthorized releases. However, minor *de minimis* staining of concrete pads, soil and gravel was observed in various areas in the leased storage yards.

Small amounts of routine cleaning and office supplies were also observed in the commercial building at the subject Property. These materials are utilized and/or stored in *de minimis* quantities unlikely to environmentally impact the subject Property.

6.2 Wastestream Processing and Disposal

Wastes generated at the subject Property include used oil (including used hydraulic oil), used batteries, waste paint and spent aerosol cans. These wastes are stored at interior locations in covered 55-gallon metal drums. No secondary containment was observed for these liquid wastes. The waste hauler(s) were not identified.

No improper wastestream processing or disposal practices were observed on the subject Property. Although one empty 55-gallon drum was observed, no unidentified suspect containers that might be used for the storage or disposal of hazardous materials or regulated substances were observed. No signs of improper material disposal were observed at the subject Property although the housekeeping was generally poor throughout the storage yard.

Refer to the HWTS sub-section of section 8.1.2 for further discussion of known past wastes generated at the subject Property.

6.3 Wastewater and Stormwater Discharges

Interior wastewater at the commercial building on the subject Property is limited to effluent from the restrooms, a trench drain near the storage room in the commercial building, and kitchen fixtures including three floor drains in the kitchen. Interior wastewater from the residences are likely limited to effluent from the restrooms and kitchen fixtures. This wastewater flows into the municipal sanitary sewer system. At the time of the site visit, no spills or staining were observed in the interior portions of the commercial building. No stormwater drains or subsurface wastewater features were observed.

6.4 Local/State Waste Disposal Compliance

At the time of the site visit, the subject Property appeared to comply with local and state waste disposal regulations.

6.5 Storage Tanks

6.5.1 Aboveground Storage Tanks (ASTs)

No ASTs or evidence of past ASTs was observed on the subject Property at the time of the site inspection.

6.5.2 Underground Storage Tanks (USTs)

During the site inspection, no evidence of USTs was observed on the subject Property. In particular, the Assessor searched for: fill pipes, vent pipes, areas of abnormal or heavy staining, manways, manholes, access covers, concrete pads not homogeneous with surrounding surfaces, concrete build-up areas potentially indicating pump islands, abandoned pumping equipment, or fuel pumps. In addition, the ADR Assessor contacted the Orange Fire Department (OFD), Orange County Health Care Agency (OCHCA), and the Regional Water Quality Control Board (RWQCB) and searched the *GeoTracker* website in an effort to determine whether USTs have been reported at the subject Property. The OFD, OCHCA, and RWQCB have no records pertaining to USTs at the subject Property. In addition, the subject Property was not listed on the *GeoTracker* website.

6.6 Indications of Polychlorinated Biphenyls (PCBs)

6.6.1 PCB-Containing Exterior Electrical Transformers

At the time of the site inspection, one pad-mounted electrical transformer was observed north of the subject Property commercial building. This unit showed no apparent signs of damage or past leakage and is owned by SCE, the provider of electrical power to the subject Property. Based on the age of construction (1979/1980) of the commercial structure on the subject Property, it is unlikely that the dielectric fluid contained in the transformers would contain PCBs. Regardless of PCB content, SCE has historically assumed responsibility for its PCB-containing transformers.

6.6.2 PCB-Containing Fluorescent Light Fixture Ballasts

Fluorescent light fixtures were observed on the subject Property commercial building. Based on the age (post-1978) of this structure it is unlikely that the ballasts associated with these fixtures contain PCBs. However, if a light ballast is found to be leaking, require replacement, or contents are subject to disposal, it would be prudent to identify the chemical content of the fluids.

No access was provided to the residences or garage. Therefore, it is unknown whether fluorescent light fixtures are present in those buildings.

6.6.3 PCB-Containing Interior Capacitors, Equipment, or Electrical Transformers

During the on-site inspection, no evidence was observed of items that could possibly contain PCB-contaminated fluid. During the on-site inspection, no evidence was observed of additional items that could possibly contain PCB-contaminated fluid. However, no access to several spaces in the subject Property commercial building was provided. Thus, it is possible that unseen equipment (e.g., elevator) might contain

hydraulic fluid or oil. Regardless, based on its age (1979/1980), it is unlikely any unseen equipment would contain PCB-containing fluid.

6.7 Solid Waste Disposal

At the time of the inspection, three waste dumpsters were observed throughout the subject Property. These dumpsters were constructed of metal. According to stenciling on these units, CR&R owns and services the dumpsters. At the time of the site inspection, the dumpsters were filled with municipal trash and appeared to comply with local and state solid waste disposal regulations. The waste dumpsters appeared to be in good condition with no obvious signs of spills or improper disposal. At the time of the site inspection, an inspection of the ground surface around the units was conducted to search for evidence of chemical or liquid waste staining or improper disposal; however, none was observed.

6.8 Other Conditions of Potential Concern

6.8.1 Lead Based Paint

Based upon the ages of the residences and garage observed on the subject Property (pre-1978), it is possible that painted building surfaces contain lead-based paint. Significant damage to the visible painted surface areas was not observed during the site inspection. Pursuant to federal and state regulations, all suspect lead-based paint should either be presumed to contain lead or adequate rebuttal sampling should be conducted prior to renovation, including maintenance, or demolition if these activities will cause a disturbance of any suspect lead-based paint or otherwise create a lead hazard.

Based upon the age of the commercial building observed on the subject Property (post-1978), it is unlikely that painted building surfaces contain lead-based paint. In 1978 the federal government banned the use of lead-based paint in residential applications and, although not banned, use in general industry has decreased from that period of time to the present.

6.8.2 Air Quality: Indoor and Visible Emissions

No unusual smells, noxious odors, or visual emissions were observed during the inspection of the subject Property.

6.8.3 Radon

According to the United States Environmental Protection Agency (EPA), the county in which the subject Property is located has a Radon Zone Level of 3, which has a predicted average indoor screening level less than 2.0 picocuries per liter (pCi/L). This level is below the EPA response level of 4.0 pCi/L. The subject Property exhibited an unlikely potential for radon contamination based upon the geological characteristics of the area and subject building construction (concrete slab-on-grade floor).

6.8.4 Limited Mold Evaluation

During on-site observations of the subject Property commercial building, a limited mold evaluation was conducted to identify mold growth in the accessible areas of this building. This evaluation concentrated on the identification of readily visible mold

growth and areas of water intrusion that may present optimal conditions for mold growth. No areas of significant water intrusion were observed in the accessible portions of this structure. It should be noted that this evaluation was limited, as access was not provided to the interiors of the two residences, garage and several areas within the commercial building.

6.8.5 Railroad Right-of-Way

No railroad right-of-way or related features were identified on the subject Property.

6.8.6 Underground Pipelines

No indicators or evidence of underground petroleum pipelines were observed on the subject Property during the site inspection.

6.8.7 Wetlands

Wetlands are lands where saturation with water is the dominant factor determining the nature of soil development and the types of plants and animal communities living in the soil and on its surface. Wetlands can be further defined through classification according to the length of time that an area is inundated or saturated by water, and the type of plants and animals an area supports. There are five major wetland classifications: marine, estuarine, lacustrine, riverine, and palustrine. Marine and estuarine wetlands are associated with the ocean and include coastal wetlands, such as tidal marshes. Lacustrine wetlands are associated with lakes, while riverine wetlands are found along rivers and streams. Palustrine wetlands may be isolated or connected wet areas and include marshes, swamps, vernal pools, and bogs. ADR identified no evidence of visual or physical indicators of wetlands on the subject Property.

6.8.9 Agricultural Usage

ADR's historical review revealed that the majority of the subject Property and surrounding properties were agriculturally developed from as early as 1938 until sometime between 1938 and 1963. The agricultural industry currently utilizes non-persistent pesticides and herbicides, but it is possible that more persistent pesticides (such as DDT) were historically used on the subject Property.

It has been ADR's experience that low levels of persistent pesticides are sometimes detected in former agricultural areas; however, these levels are generally below levels of regulatory concern and are often further diminished during grading activities. Since the subject Property has been developed with the current light-industrial structures and asphalt parking areas, ADR concludes that the former agricultural use of the subject Property is unlikely to represent an environmental concern because the length of time since active cultivation makes pesticide degradation likely, and because pesticides in soil at the subject Property (if any) would have been significantly diluted based on the earth movement activities performed in connection with historical site development activities. Therefore, the historical presence of agricultural use at the subject Property does not represent an environmental concern or a human health risk, and ADR recommends no further investigation regarding this issue at this time.

7 CURRENT USES OF ADJOINING PROPERTIES

For the scope of this ESA, properties are defined and categorized based upon their physical proximity to the subject Property. An adjoining property is any real property whose border is contiguous or partially contiguous with the subject Property or that would be if the properties were not separated by a roadway, street, public thoroughfare, river, or stream. A neighboring property is any real property located within 0.25 mile of the subject Property's border.

7.1 Adjoining and Neighboring Properties - General Description

At the time of the site inspection, the general area surrounding the subject Property was occupied by light-industrial, commercial, residential and institutional properties. The subject Property is bordered by the following:

North: immediately by West Fletcher Avenue then by, from west to east, the Fletcher Avenue Condominiums (619 West Fletcher Avenue), Calafia Townhomes (621 West Fletcher Avenue), and Fletcher Elementary School (515 West Fletcher Avenue), and further by residential properties.

South: immediately by West Freedom Avenue followed by, from west to east, commercial/light-industrial buildings (part of the Freedom Business Park) occupied by Egg Whites International (630 West Freedom Avenue), vacant (620 West Freedom Avenue), Gardner Outdoor & Pool Remodeling (600 West Freedom Avenue) and SSR Performance (590 West Freedom Avenue), and further by residential properties.

East: immediately by North American Way, then by Fletcher Coating Company (426 West Fletcher Avenue), and further by additional commercial and light-industrial development.

West: immediately by the Fletcher Retarding Basin, and further by commercial and light-industrial development.

7.2 Adjoining and Neighboring Properties Materials Storage

No unusual or suspicious materials handling storage practices were observed on the publicly accessible portions of the adjoining and neighboring properties. The east adjoining property is occupied by a powder coating firm that likely stores and uses metallic powder coatings and solvents as a function of its business operations. The adjoining and neighboring properties are unlikely to utilize/store hazardous materials in noteworthy quantities, although the remaining adjoining properties most likely store routine office and cleaning materials in quantities that are unlikely to represent an environmental concern to the subject Property.

Based on cursory observations of materials storage and handling practices and the environmental database review, the current uses of the adjoining and neighboring properties are unlikely to represent an environmental concern to the subject Property.

7.3 Adjoining and Neighboring Properties Wastestream Disposal

No unusual or suspicious wastestream disposal activities were observed on the adjoining and neighboring properties. A cursory inspection of the adjoining properties did not reveal any improper disposal practices at the sites.

7.4 Railroad Right-of-Way

No railroad right-of-way, spurs, or railroad features were identified in the immediate vicinity of the subject Property.

8 RECORDS REVIEW

8.1 Standard Environmental Records Sources

ADR states that all databases reviewed as part of this ESA were determined to be sufficiently complete and sufficiently current to serve as the basis for ADR's opinions expressed. The subject Property was listed in the HAZNET and HWTS (3X) databases supplied by EDR. Refer to the respective subsections of section 8.1.2 for information regarding these listings. A detailed listing and a map showing all sites supplied by EDR are included in the appendix.

8.1.1 Review of Federally Reported Environmental Data

Results of the federal regulatory records search follow. Each section begins with a description of the database searched and the agency that compiles it.

National Priorities List (NPL) of Superfund Sites:

The NPL is the EPA's database of over 1,200 hazardous waste sites currently identified and targeted for priority cleanup action under the Superfund Program. A search of the 2021 National Priorities List identified no Superfund sites within 1.0 mile of the subject Property.

Superfund Enterprise Management System (SEMS):

The SEMS list tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities in support of the EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed SEMS by the EPA in 2016. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 1003 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). This dataset also contains sites that are either proposed to or on the NPL and the sites that are in the screening and assessment phase for possible inclusion on the NPL. A search of the 2021 SEMS database identified no sites within the 0.5-mile database search range.

Superfund Enterprise Management Systems Archive (SEMS-Archive):

SEMS-Archive tracks sites that, based on available information, have no further interest under the Federal Superfund Program. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS-Archive by the EPA in 2016. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the NPL unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site. A search of the 2021 SEMS-Archive database identified three (3) sites within the 0.5-mile database search range. Based on their distance (>0.15 miles)

from the subject Property, their cross- or down-gradient locations with respect to groundwater flow direction, and/or their regulatory status (archived), it is unlikely these sites represent an environmental concern to the subject Property.

Emergency Response Notification System (ERNS):

The ERNS database is the historical record of all reported releases of oil and other hazardous substances. A search of the 2020 ERNS database did not identify a release on the subject Property.

Resource Conservation and Recovery Act (RCRA) Treatment, Storage and Disposals (TSD) Facilities:

The RCRA program identifies and tracks hazardous waste from generation source to the point of ultimate disposal. The RCRA-TSD facilities database is the composite of reporting facilities that store, transport, treat, or dispose of controlled or hazardous waste. Identification on this list does not indicate that a site has impacted the environment. A search of the 2021 RCRA-TSD facilities database identified one (1) site within the 0.5-mile database search range. It is unlikely that this site represents an environmental concern to the subject Property due to its distance (>0.15 miles) from the subject Property and its down-gradient location with respect to groundwater flow direction.

Resource Conservation and Recovery Act (RCRA) Facilities:

The RCRA program identifies and tracks hazardous waste from generation source to the point of ultimate disposal. The RCRA facilities database is the composite of reporting facilities that generate hazardous waste. Identification on this list does not indicate that a site has impacted the environment. A search of the 2021 RCRA facilities database identified two (2) large quantity generator sites including a south adjoining property (General Coatings Corp. at 600 West Freedom Avenue), thirteen (13) small quantity generator sites including the westernmost south adjoining property (Duratech Industries at 630 West Freedom Avenue), no very small quantity generator (VSQG) sites, and thirty-nine (39) former generator sites including the east (2X) adjoining property (Fletcher Coating Co. and Rick's Truck Works at 426 West Fletcher Avenue) and the easternmost south adjoining property (SSR Performance at 590 West Freedom Avenue) within the 0.25-mile database search range.

According to information provided by EDR, the General Coatings Corp. was a south adjoining property located across West Freedom Avenue that was a large quantity generator with violations. Based on its distance (>100 feet) from the subject Property, its down-gradient location with respect to groundwater flow direction, and its regulatory status (not identified on a database that indicates an adverse impact to the environment), it is unlikely this listing represents an environmental concern to the subject Property.

According to information provided by EDR, the Duratech Industries was a south adjoining property located across West Freedom Avenue that was a small quantity generator with no violations. Based on its distance (>100 feet) from the subject Property, its down-gradient location with respect to groundwater flow direction, and its regulatory status (no violations and not identified on a database that indicates an

adverse impact to the environment), it is unlikely this listing represents an environmental concern to the subject Property.

According to information provided by EDR, the easternmost south adjoining SSR Performance located across West Freedom Avenue formerly generated hazardous waste and had no violations. Based on its distance (>100 feet) from the subject Property, its down-gradient location with respect to groundwater flow direction, and its regulatory status (not identified on a database that indicates an adverse impact to the environment), it is unlikely this listing represents an environmental concern to the subject Property.

According to information provided by EDR, Fletcher Coating Co. and Rick's Truck Works are the east adjoining property located across North American Way previously generated hazardous waste and had no violations. Based on their distance (>60 feet) from the subject Property and their regulatory status (no violations and not identified on a database that indicates an adverse impact to the environment), it is unlikely these listings represent an environmental concern to the subject Property.

It is unlikely that the remaining sites represent an environmental concern to the subject Property due to their distance (>100 feet) from the subject Property, their regulatory status (no violations and/or not identified on a database that indicates an adverse impact to the environment), and/or their cross- or down-gradient locations with respect to groundwater flow direction.

RCRA Corrective Action (RCRA-CA) Sites:

The RCRA-CA (CORRACTS database) report contains information pertaining to facilities that have conducted, or are currently conducting, corrective actions as regulated by the Resource Conservation and Recovery Act. A search of the 2021 RCRA-CA list identified one (1) site within the 1.0-mile database search range. It is unlikely that this site represents an environmental concern to the subject Property due to its distance (>0.15 miles) from the subject Property and its down-gradient location with respect to groundwater flow direction.

Facility Index System (FINDS) Report:

The FINDS Report is a computerized inventory of all facilities that are regulated or tracked by the U.S. Environmental Protection Agency. These facilities are assigned a unique identification number that serves as a cross-reference for databases in the EPA's program system. A search of the 2021 FINDS database did not identify the subject Property.

Enforcement and Compliance History Information (ECHO) Database:

The EPA's ECHO system incorporates data from the Facility Registry Service (FRS) to link records representing data about the same facility across different programmatic database systems. ECHO provides integrated compliance and enforcement information for about 800,000 regulated facilities nationwide. Identification on this database does not indicate that a site has impacted the environment. A search of the 2021 ECHO database did not identify the subject Property.

8.1.2 Review of California Reported Environmental Data

Results of the California regulatory records search follow. Each section begins with a description of the database searched and the state agency that compiles it.

Hist CalSites Database:

The Historic CalSites database contains potential or confirmed hazardous substance release properties and includes the former ASPIS (Abandoned Sites Program Information System) database. This database was created since the Department of Toxic Substances and Control (DTSC) no longer updates the CalSites database. A search of the 2005 Hist CalSites database identified one (1) site within the 1.0-mile database search range. It is unlikely that this site represents an environmental concern to the subject Property due to its distance (>0.6 miles) from the subject Property and its down-gradient location with respect to groundwater flow direction.

Response Database (Response):

The Response database identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk sites. A search of the 2021 Response database identified two (2) sites within the 1.0-mile database search range. It is unlikely that these sites represent an environmental concern to the subject Property due to their distance (>0.6 miles) from the subject Property, regulatory status (certified as having been satisfactorily remediated) and/or their cross- or down-gradient location with respect to groundwater flow direction.

EnviroStor Database:

The DTSC's Site Mitigation and Brownfields Reuse Program's (SMBRP's) *EnviroStor* database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including military facilities, and State Superfund; Voluntary Clean-up sites; and school sites. *EnviroStor* provides similar information to the information that was available in CalSites, and provides additional site information including, but not limited to, identification of formerly contaminated properties that have been released for re-use, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites. A search of the 2021 *EnviroStor* Database identified twelve (12) sites within the 1.0-mile database search range. It is unlikely that these sites represent an environmental concern to the subject Property due to their distance (>0.15 miles) from the subject Property, status (no further action, no action required, or certified) and/or their down- or cross-gradient locations with respect to groundwater flow direction.

California Bond Expenditure Plan (BEP):

The BEP database identifies sites for which a site-specific expenditure plan has been prepared as the basis for an appropriation of Hazardous Substance Cleanup Bond Act funds. A search of the 1989 BEP database identified no sites within the 1.0-mile database search range.

Leaking Underground Storage Tanks (LUSTs):

The California Water Resources Control Board, in cooperation with the Office of Emergency Services, maintains an inventory of LUSTs in a statewide database. A search of the 2021 LUST database identified twenty-one (21) reported LUST sites within the 0.5-mile database search range. According to information provided by EDR, nineteen (19) of these cases are closed. It is unlikely that these sites represent an environmental concern to the subject Property due to their distance (>250 feet) from the subject Property, their regulatory status (case closed) and/or their down- or cross-gradient locations with respect to groundwater flow direction.

Cortese Database:

The Cortese list contains hazardous waste and substance sites compiled pursuant to Assembly Bill 3750 (Cortese, Chapter 1048, Statutes of 1986). The information included in this list comes from the State Department of Health Services (public drinking water wells with detectable levels of contamination; hazardous substance sites selected for remedial action; historic Cortese sites; and sites with known toxic material identified through the abandoned site assessment program). This includes the State Water Resources Control Board (sites with known USTs having a reportable release), and the California Waste Management Board (solid waste disposal facilities from which there is a known migration). A search of the 2001 Historic Cortese database and the 2021 Cortese database identified twenty-two (22) sites within the 0.5-mile database search range. Many of these listings are redundant. It is unlikely that these sites represent an environmental concern to the subject Property due to their distance (>250 feet) from the subject Property, their regulatory status (case closed) and/or their down- or cross-gradient locations with respect to groundwater flow direction.

Solid Waste Facilities/Landfill Database (SWF/LF):

Solid Waste Facilities/Landfill Database (SWF/LF) records comprise an inventory of solid waste disposal facilities or landfills. A search of the 2021 SWF/LF database identified three (3) sites within the 0.5-mile database search range. It is unlikely that these sites represent an environmental concern to the subject Property due to their distance (>0.25 miles) from the subject Property and/or their regulatory status (closed).

Solid Waste Assessment Test Database (SWAT):

The SWAT Database comprises an inventory of landfills investigated for potential groundwater impacts. A search of the 2000 SWAT database identified three (3) sites within the 0.5-mile database search range. It is unlikely that these sites represent an environmental concern to the subject Property due to their distance (>0.4 miles) from the subject Property and/or their cross-gradient locations with respect to groundwater flow direction.

Underground Storage Tanks (USTs):

USTs are regulated under Subtitle I of the RCRA and must be registered with the state of California. These are registered USTs only, and identification on this list does not indicate that the site has impacted the environment. A search of the 2021

California State Water Resources Control Board (SWRCB), the 1994 California Environmental Protection Agency UST, 1994 SWEEPS UST, and the 1990 SWRCB historical UST databases identified thirty-eight (38) listings including the east adjoining property within the 0.25-mile database search range. Many of these listings are redundant.

According to information provided by EDR, the east adjoining property across North American Way (Fletcher Coating Co.) operates a UST and no release has been reported. Based on its distance (>60 feet) from the subject Property and its regulatory status (no release reported), it is unlikely this listing represents an environmental concern to the subject Property. It is unlikely that the remaining sites represent an environmental concern to the subject Property due to their distance (>250 feet) from the subject Property, their down- or cross-gradient location with respect to groundwater flow direction, and/or their regulatory status (no release reported or USTs removed and case closed).

Waste Discharger System (WDS) Report:

The WDS report contains information for all regulated wastewater and hazardous waste discharges to public waterways, groundwater or sewer systems in California. Identification on this list does not necessarily indicate that a site has impacted the environment. A search of the 2007 WDS database did not identify the subject Property.

Cleanup Program Sites Spills, Leaks, Investigations and Cleanups (CPS-SLIC) Database:

The CPS-SLIC database is maintained by the State Water Resources Control Board and contains information for all reported hazardous material/waste surface or groundwater contamination investigations in California. A search of the 2021 CPS-SLIC database identified no CPS-SLIC sites within the 0.5-mile database search range.

Facility and Manifest Data (HAZNET):

The HAZNET database is information extracted from the copies of hazardous waste manifests received each year by the DTSC. Inclusion on this list identifies a site as a likely generator of hazardous waste. However, identification on this list does not indicate that a site has impacted the environment. A search of the 2019 HAZNET database identified the subject Property – Bob Wetzel Concrete. Refer to the HWTS sub-section below for discussion of this listing.

Hazardous Waste Tracking System (HWTS):

The HWTS is the DTSC's data repository for hazardous waste Identification (ID) numbers and manifest information. HWTS generates reports on hazardous waste shipments for generators, transporters, and TSDFs. Inclusion on this list identifies a site as a likely generator of hazardous waste. However, identification on this list does not indicate that a site has impacted the environment. A search of the 2020 HWTS database identified the subject Property (3X). ADR also reviewed the online HWTS database and information obtained from the online HWTS is summarized in the table below.

Firm Name and Suite	Generator No.	Additional Information
L&K Rental, Inc. 2390 American Way (subject Property)	CAL000249191	The generator number was entered into the HWTS in April 2002 and was inactive by June 2009. No details of the wastes generated were provided.
Mr. Landscape 2390 American Way (subject Property)	CAL000267367	The generator number was entered into the HWTS in March 2003 and was inactive by July 2004. No details of the wastes generated were provided.
Bob Wetzel Concrete, Inc. 2390 N. American Way (subject Property)	CAC002788347	The generator number was entered into the HWTS in October 2014 and was inactive by January 2015. One 2014 waste manifest covering the disposal of approximately 0.15 tons of off-spec., aged or surplus organics is associated with this generator number.

Since these waste materials were properly removed from the site and no significant staining or other evidence of improper waste handling procedures was observed, it is unlikely these listings represent an environmental concern to the subject Property. Copies of the EPA ID Profile reports obtained from the HWTS database are included in the appendix.

Cleaners:

The Department of Toxic Substances Control maintains a list of dry cleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaning agents; linen supply; coin-operated laundries and cleaning; dry cleaning plants, except rugs; carpet and upholstery cleaning; industrial launderers; laundry and garment services. A search of the 2021 Cleaners database did not identify the subject Property.

California Hazardous Material Incident Reporting System (CHMIRS)

CHMIRS contains information on reported hazardous material incidents (accidental releases or spills). A search of the 2020 CHMIRS database did not identify the subject Property.

Emissions Inventory (EMI):

The EMI database contains information for all reported air quality related emissions in California. A search of the 2018 EMI database did not identify the subject Property.

CERS Hazardous Waste (CERS HAZ WASTE) Database:

The CERS HAZ WASTE database is maintained by the California Environmental Protection Agency (CalEPA) and tracks sites that fall under the Hazardous Chemical Management, Hazardous Waste Onsite Treatment, Household Hazardous Waste Collection, Hazardous Waste Generator, and RCRA Large Quantity Hazardous Waste Generator programs. A search of the 2021 CERS HAZ WASTE database did not identify the subject Property.

CERS Database:

The CERS database is maintained by the California Environmental Protection Agency (CalEPA) and combines data about environmentally regulated sites and facilities in California into a single database. It combines data from a variety of state and federal databases and provides an overview of regulated activities across the spectrum of environmental programs for any given location in California. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials. A search of the 2021 CERS database did not identify the subject Property.

California Environmental Reporting System (CERS) Tanks:

The CERS Tanks database lists sites in the CalEPA Regulated Sites portal that fall under the AST or UST regulatory programs. A search of the 2021 CERS Tanks database did not identify the subject Property.

National Pollutant Discharge Elimination System (NPDES):

The NPDES database contains information regarding NPDES permits, including stormwater permits, issued by the California State Water Resources Control Board (SWRCB). A search of the 2021 NPDES database did not identify the subject Property.

California Integrated Water Quality System (CIWQS):

The CIWQS database is a computer-based system maintained by the Regional Water Quality Control Board (RWQCB) that tracks information about places of environmental interest, manages permits and other orders, tracks inspections, and manages violations and enforcement activities. A search of the 2020 CIWQS database did not identify the subject Property.

California Department of Conservation, Geologic Energy Management Division (GEM):

The Department of Conservation, Geologic Energy Management Division (GEM) prepares and publishes oil, gas, and geothermal maps for the State of California. The GEM updates these comprehensive maps weekly with the most current well data and post the information on its website at https://www.conservation.ca.gov/calgem. According to the GEM online well finder database, no active or plugged oil wells are located on the subject Property.

8.1.3 County/Local Agency Records Search

Following is a discussion of records searches performed or personal/telephone contacts made with the appropriate local government agencies for environmental issues relative to the subject Property.

Orange Fire Department (OFD):

The ADR Assessor contacted the OFD in an effort to determine whether hazardous material storage/usage, and/or responses to incidents involving spills or releases

have been reported at the subject Property address. According to Ms. Barbara Reid, City Clerk, no records were found for the subject Property addresses.

Regional Water Quality Control Board – Los Angeles Region (RWQCB):

The ADR Assessor contacted the RWQCB and reviewed the *Geotracker* website in an effort to determine whether hazardous material releases, LUST or USTs, or cleanup actions have been reported at the subject Property address. According to a response from the RWQCB, no records were found for the subject Property addresses. In addition, a review of the *Geotracker* website did not indicate any hazardous materials releases, LUST or USTs, or cleanup actions at the subject Property.

Department of Toxic Substances Control (DTSC):

The ADR Assessor contacted the DTSC and searched the DTSC on-line *EnviroStor* website in an effort to determine whether spills, site cleanup, remediation or hazardous material incidents have been reported at the subject Property. According to Ms. Jone Barrio, Regional Records Coordinator with the DTSC, the DTSC has no records pertaining to the subject Property. In addition, the addresses associated with the subject Property were not listed on the *EnviroStor* database or on the *EnviroStor* website.

South Coast Air Quality Management District (AQMD):

The ADR Assessor contacted the AQMD and reviewed the AQMD's FIND database in an effort to determine whether any permits involving air pollution control technology, notices of violation, notices to comply or complaints had been reported at the subject Property. According to information provided by the AQMD, indicated Adair Roofing at 2390 North American Way obtained permits in 2005, 2010 and 2011 to operated tar kettles fueled by propane at job sites. No records indicating violations were provided for the subject Property. In addition, A&M Tree Specialist at 2390 North American Way were inspected in 2013 and determined that no permits were needed for their operation. Records obtained from the AQMD are included in the appendix of this ESA.

Stormwater Multiple Application and Report Tracking System (SMARTS):

The ADR Assessor searched the SWRCB Storm Water Multiple Application & Reporting System (SMARTS) database in an effort to determine whether stormwater permits had been obtained for the subject Property. The subject Property was not identified on the SMARTS database.

Orange County Health Care Agency (OCHCA):

The ADR Assessor contacted the OCHCA in an effort to determine whether any responses to incidents involving the spill or release of hazardous materials or whether any USTs had been reported at the subject Property. ADR has not received a response from the OCHCA at the time of this ESA. Based on information from other sources, it is unlikely that the OCHCA would have any information that would alter the conclusions of this report.

Orange County Sanitation District (OCSD):

The ADR Assessor contacted the OCSD in an effort to determine whether any wastewater issues or clarifiers have been reported on the subject Property. According to Ms. Tina Knapp with the OCSD, no records exist for the subject Property.

Orange County Fire Authority (OCFA):

The ADR Assessor contacted the OFD in an effort to determine whether hazardous material storage/usage, and/or responses to incidents involving spills or releases have been reported at the subject Property address. According to Ms. Iris Vicent with the OCFA, the OCFA has no records pertaining to the subject Property addresses.

8.2 Vapor Encroachment Conditions

ADR has performed a Vapor Encroachment Screening (Tier 1) in general accordance with the scope of work and limitations of ASTM Standard Practice E 2600-15 for the subject Property. The purpose of this Vapor Encroachment Screening (Tier 1) was to identify existing or potential Vapor Encroachment Conditions (VEC) (as defined by ASTM Standard E 2600-15) affecting the subject Property. No releases were identified that would represent a VEC in connection with the subject Property. As such, no further assessment is recommended.

8.3 Synopsis of Previous Environmental Investigations

ADR was provided a copy of a June 10, 2020, "Environmental Property Assessment" and a February 8, 2021, "Phase I Environmental Site Assessment Report Update" both prepared by AEI Consultants, Inc. (AEI). Copies of these reports as provided to ADR are included in the appendix. A summary of each report follows.

At the time of the 2020 AEI site inspection, the subject Property was developed with four structures consisting of an approximate 68,000 square foot multi-tenant commercial building at 2390 North American Way, two residences totally approximately 4,300 square feet at 2442 and 2444 North American Way, and a garage along the northern portion. In addition, several large containers used by the tenants for storage were observed on the subject Property, which were inaccessible. No hazardous materials or chemicals were reported within these containers. Tenants of the commercial building included the American Way Cultural Center, A-1 Septic Pumping, Adan Tree Specialist, D&N Sealing, Duarte Ramos Cycling, Frank & Sons Enterprises, Gregorios Pallets, Hipolito V. Alvarez, Ledesma Pallets, and Orange Pool Plastering. The majority of these commercial tenants used the subject Property for storage. Gregorios Pallets and Ledesma Pallets used the subject Property for pallet manufacturing and storage. AEI did not identify evidence of RECs or CRECs in connection with the subject Property during the course of their assessment and recommended no further investigation for the subject Property at that time. AEI did state that due to the large volume of materials within portions of the building and vehicles, equipment, pallets, and natural materials within exterior areas, direct visual observation of many of the floor and wall areas of the building and exterior ground surfaces was not possible. Access inside several large storage containers was not provided. In addition, although AEI noted the potential for asbestos containing materials and lead containing paints in the structures on the subject Property, AEI also indicated that all such materials

appeared to be in good condition. AEI recommending sampling prior to renovation and/or demolition.

The conclusions of the 2021 AEI report were similar to that of the 2020 report. Access to all tenants on the subject Property was provided during this assessment.

9 FINDINGS, OPINIONS AND CONCLUSIONS

This section presents a summary of available information on known or suspected *recognized environmental conditions, historical recognized environmental conditions, controlled recognized environmental conditions, business environmental risks,* non-scope ASTM environmental concerns, environmental concerns not considered *recognized environmental conditions,* and *de minimis conditions* (if any) at the subject Property. It also includes ADR's opinion and rationale for concluding that a condition is, or is not, currently a *recognized environmental condition.*

Recognized environmental conditions:

- None

Historical recognized environmental conditions:

- None

Controlled recognized environmental conditions:

- None

Business environmental risks:

- In 1971, the City of Orange issued a building permit for the installation of a 550-gallon gasoline storage tank at 560 W. Fletcher Avenue, a historical address associated with the subject Property. The permit did not indicate whether the tank was actually installed or whether the permit pertained to an AST or UST. In addition, no record of a tank removal/abandonment was located. Lastly, no evidence of a storage tank (AST or UST) was observed during the site inspection or during ADR's historical aerial photograph review. Based on this building permit, it is possible that a small gasoline UST remains on the subject Property. However, based on the small capacity of the referenced tank, the depth to groundwater, which exceeds 130 feet, and the lack of evidence of a release, if a UST was installed, it is unlikely that the tank would have significantly impacted the subject Property (e.g., impacted groundwater). Regardless, if a UST is encountered during future redevelopment activities at the subject Property, ADR recommends a licensed contractor abandon the tank in accordance with all applicable regulations.

Non-ASTM scope environmental concerns:

- None

De minimis environmental conditions:

- Minor staining of concrete pads, soil and gravel was observed in various areas in the leased storage yards. Staining can be an indication of poor hazardous materials handling. Based on the size of the stains and materials observed onsite during the site inspection (e.g., hydraulic fluid, latex paints, etc.) it is unlikely that this staining represents an environmental concern. With the exception of better handling practices, including storing materials in secondary containment and collecting and

disposing of any spilled material promptly, ADR recommends no additional action or investigation regarding the observed staining.

ADR has performed an ESA on the site located at 2390-2444 North American Way in Orange, California. This ESA was performed in conformance with the scope and limitations of ASTM Standard Practice E 1527-13, AAI and the scope of services identified in the July 30, 2014, Master Environmental Consulting Services Agreement (MSA) between Rexford Industrial Realty, L. P., and ADR. This ESA has identified no evidence of recognized environmental conditions as defined by ASTM in connection with the subject Property.

10 RECOMMENDATIONS

Based upon the conclusions of this ESA, ADR recommends no further investigation or additional action regarding the environmental condition of the subject Property.

11 SIGNATURE PAGE

This ESA was prepared in accordance with generally accepted environmental practices and procedures, employing the degree of care and skill ordinarily exercised under similar circumstances by reputable environmental professionals practicing in this area, as of the date of this ESA.

We declare that, to the best of our professional knowledge and belief, we meet the definition of *Environmental Professional* as defined in §312.10 of 40 CFR 312 and the individuals conducting this ESA have the specific qualifications based on education, training, and experience to assess a *property* of nature, history, and setting of the subject Property. ADR has developed and performed the all-appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by ADR Environmental Group, Inc were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # C8CA-448E-AEF5

PO # NA

Project REXF 299

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: C8CA-448E-AEF5

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 04/27/2021 has revealed that there are 3 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/22/2021 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 03/22/2021 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA)

of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/22/2021 has revealed that there are 2 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/22/2021 has revealed that there are 13 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent NPL

CA RESPONSE: Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

A review of the CA RESPONSE list, as provided by EDR, has revealed that there are 2 CA RESPONSE sites within approximately 1 mile of the target property.

CA ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the CA ENVIROSTOR list, as provided by EDR, and dated 01/25/2021 has revealed that there are 12 CA ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

CA SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the CA SWF/LF list, as provided by EDR, has revealed that there are 3 CA SWF/LF sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

CA UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the CA UST list, as provided by EDR, has revealed that there are 6 CA UST sites within approximately 0.25 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Landfill / Solid Waste Disposal Sites

CA WMUDS/SWAT: The Waste Management Unit Database System is used for program tracking and inventory of waste management units. The source is the State Water Resources Control Board.

A review of the CA WMUDS/SWAT list, as provided by EDR, and dated 04/01/2000 has revealed that there are 3 CA WMUDS/SWAT sites within approximately 0.5 miles of the target property.

Local Lists of Hazardous waste / Contaminated Sites

CA HIST Cal-Sites: Formerly known as ASPIS, this database contains both known and potential hazardous substance sites. The source is the California Department of Toxic Substance Control. No longer updated by the state agency. It has been replaced by ENVIROSTOR.

A review of the CA HIST Cal-Sites list, as provided by EDR, and dated 08/08/2005 has revealed that there is 1 CA HIST Cal-Sites site within approximately 1 mile of the target property.

Local Lists of Registered Storage Tanks

CA SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the CA SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 5 CA SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/22/2021 has revealed that there are 39 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

CA Cortese: The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).

A review of the CA Cortese list, as provided by EDR, and dated 03/22/2021 has revealed that there are 12 CA Cortese sites within approximately 0.5 miles of the target property.

CA HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency. This database begins with calendar year 1993.

A review of the CA HAZNET list, as provided by EDR, and dated 12/31/2019 has revealed that there are 38 CA HAZNET sites within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
ORANGE TRUCK STOP	643 W FLETCHER AVE	NNW 0 - 1/8 (0.022 mi.)	B14	76

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 2 EDR Hist Cleaner sites within approximately 0.25 miles of the target property.

CERS:
- Name: FLETCHER COATING CO
- Address: 2467 N AMERICAN WAY
- City,State,Zip: ORANGE, CA 92865
- Site ID: 532099
- CERS ID: 224628
- CERS Description: Industrial Facility Storm Water

Violations:
- Site ID: 532099
- Site Name: Fletcher Coating Co
- Violation Date: 05-19-2004
- Citation: 2014-0057-DWQ - Industrial General Permit
- Violation Description: SW - Deficient BMP Implementation
- Violation Notes: SWPPP MUST BE IN AL OCATION THAT CAN BE ACCESSED DURIONG BUSINESS HOURS. NEEDS TO REEVALUATE CURRENT SMPLING POINTS.
- Violation Division: Water Boards
- Violation Program: INDSTW
- Violation Source: SMARTS

- Site ID: 532099
- Site Name: Fletcher Coating Co
- Violation Date: 10-27-2005
- Citation: 2014-0057-DWQ - Industrial General Permit
- Violation Description: SW - Deficient Report
- Violation Notes: This site failed to analyze Table D parameters for 2004-2005 Annual Report.
- Violation Division: Water Boards
- Violation Program: INDSTW
- Violation Source: SMARTS

Evaluation:
- Eval General Type: Compliance Evaluation Inspection
- Eval Date: 01-11-2002
- Violations Found: No
- Eval Type: Industrial Storm Water Compliance Evaluation
- Eval Notes: Address for site should be corrected to read: 426 Fletcher Avenue, Orange, CA 92865. Arrived on site at approximately 10:00 a.m., clear skies, approximately 70 degrees F. Met with Kurtis Breeding and new CEO (Don?). Reviewed the site monitoring reports and SWPPP. SWPPP was in place in October 2001. Mr. Breeding stated that the business operated from 7:00 a.m. to 3:30 p.m., and that he is the primary contact for storm water and has received some training via his consultant (Jorgensen). SWPPP appeared to be adequate. Conducted site inspection. In general, the site appeared to be in compliance; however, we did identify a few areas that required better housekeeping. Stated that pipes/supplies are kept covered with tarp in the event of rain. Areas needing improvement included the following: (1) scrap metal bins needs to be kept covered with tarp, in the event of rain; (2) several 55-gallong drums need to be collected and stored appropriately; (3) rust from pipes on ashalt-covered area needs to be swept on a routine basis; (4) blow-by water from compressor needs secondary containment; and (5) tracking from trucks along American Way needs to be swept on a routine basis.
- Eval Division: Water Boards
- Eval Program: INDSTW
- Eval Source: SMARTS

FLETCHER COATING CO (Continued) **U001577488**

Eval General Type: Complaint Inspection
Eval Date: 05-19-2004
Violations Found: No
Eval Type: Industrial Storm Water Complaint Inspection
Eval Notes: On May 19, 2004. Regional Water Board staff conducted a routine inspection at the above mentioned site. Contact was made with John Bejarano the Plant Manager. The SWPPP and inspection logs could not be reviewed at this time due to the fact that they were locked up in another office and there was no access to them. Upon inspection of the facility the following observations were made. The facility was about 50 percent asphalt and 50 percent loose sediment and rock. The majority of operations occurred indoors or under some type of coverage. Although, a large amount of materials are stored outside. Based on previous analytical sampling it is staff's best professional judgment that the sampling points are not reflective of the actual discharges that can occur on this site. Therefore the site should re-evaluate this portion of the program. Large amounts of rust was noted in the ground located in the northwest portion of the facility.

Hazardous Waste Summary:
Waste Code: D001
Waste Description: IGNITABLE WASTE

Waste Code: D005
Waste Description: BARIUM

Waste Code: D006

GENERAL COATINGS CORPORATION (Continued) **1001486896**

Waste Description: CADMIUM

Waste Code: D007
Waste Description: CHROMIUM

Waste Code: D008
Waste Description: LEAD

Waste Code: D035
Waste Description: METHYL ETHYL KETONE

Waste Code: F002
Waste Description: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F003
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F005
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System:
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

WATER HEATER MAN INC (Continued) **S123517636**

Citation:	22 CCR 15 66265.173 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.173
Violation Description:	Failure to meet the following container management requirements: (a) A container holding hazardous waste must always be closed during storage, except when it is necessary to add or remove waste. (b) A container holding hazardous waste must not be opened, handled, or stored in a manner which may rupture the container or cause it to leak.
Violation Notes:	Returned to compliance on 02/20/2018. OBSERVATION: All hazardous waste containers shall be closed at all times except when adding or removing waste. CORRECTIVE ACTION: Immediately close these containers and ensure all hazardous waste containers are closed when not adding or removing waste. Violation was corrected during this inspection.
Violation Division:	Orange County Environmental Health
Violation Program:	HW
Violation Source:	CERS
Site ID:	412678
Site Name:	WATER HEATER MAN INC
Violation Date:	03-31-2015
Citation:	22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Description:	Failure to properly label hazardous waste accumulation containers with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.
Violation Notes:	Returned to compliance on 09/08/2015. The drums storing used oil were unmarked. All containers storing hazardous waste must be marked with the required identifying information. Labels were provided. Violation corrected.

WATER HEATER MAN INC (Continued) **S123517636**

Eval Notes:	On site for a routine hazardous waste inspection. Robert Villasenor, facilitator, was present for the inspection and provided consent to inspect. The facilityG s operations and the waste generated were discussed. The inspection included a walk of the facility's outside perimeter and its trash storage areas. I did not observe hazardous waste in the facility's trash or as run off on the ground. The storage of the shop's hazardous waste was inspected. The storage containers were stored closed. The receipts for the removal of the facility's hazardous waste were on site and available for inspection. The records for the last year were reviewed. We discussed acceptable on site hazardous waste storage times for the volume of used oil that they generate. This facility is a conditionally exempt small quantity generator (CESQG). The facility had spill response directions and emergency contact numbers posted for the employees. report PDF to cswhminc@earthlink.net [Truncated]

Eval Notes:	On site to conduct a routine Hazardous Waste inspection. Met with Jalinda Sharland, Chief Operating Officer. The facility is a Small Quantity Generator of automotive repair wastes. Walked throughout the facility and observed the facilityG s Hazardous Waste storage areas. Hazardous Waste containers were observed properly labeled and stored closed. The perimeter of the facility was walked and the municipal trash was observed. There are no signs of illegal disposal. Hazardous waste manifests were available for review. The facilityG s EPA ID number is active. Emergency plan is maintained on site. No hazardous waste violations were observed this date. This inspection report was sent to jalinda@waterheatermaninc.com.

Reclamation: Not reported
POTW: Not reported
Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System:
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Eval Type:	Routine done by local agency
Eval Notes:	On site for a routine hazardous waste inspection. Mike Carter, vice president, was present for the inspection and provided consent to inspect. The facilityG s operations and the waste generated were discussed. The inspection included a walk of the facility's outside perimeter and its trash storage areas. I did not observe hazardous waste in the facility's trash or as run off on the ground. The storage of the shop's hazardous waste was inspected. The storage containers were closed and labeled with the required information. The receipts for the removal of the facility's hazardous waste were on site and available for inspection. The records for the last year were reviewed. The facility had a SPCC plan, which contained spill response directions and emergency contact numbers. report PDF to mike@streetsweeper.com

Eval Notes:	On site for a routine above ground petroleum storage tank (APST) inspection. Mike Carter, vice president, was present for the inspection and provided consent to inspect. This facility is regulated under the Above Ground Storage Act (APSA). There is equal to or greater than 1,320 but less than 9,999 gallons of regulated petroleum products in drums or tanks sized 55 gallons or larger on site. We reviewed the qualifying petroleum above ground storage on site, which included oils, used oil, and diesel fuel. The facility had a Spill Prevention, Control and Countermeasure (SPCC) plan. The plan was on site and available for review. SPILL CONTROL: Secondary containment and spill response equipment was provided as described in the plan. INSPECTIONS: Weekly inspections were conducted as described in the

BILLS SWEEPING SVC INC (Continued) **S113058554**

plan. Inspection records were on site and available for inspection. EMPLOYEE TRAINING: Annual employee SPCC training was discussed. report PDF to [Truncated]

Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: On site to conduct a routine Aboveground Petroleum Storage Tank (APST) inspection. Met with Mike Carter, President. The facility is a Tier I Qualified Facility. The following petroleum storage capacity was observed: - 2,000 gallons diesel, double-walled tank - 220 gallon waste oil, double-walled tank - 200 gallon new motor oil, single-walled tank with containment The 2,000 gallon diesel APST has tertiary containment and the 200 gallon new motor oil APST is stored within fiberglass containment. Containment was observed free of liquid and debris at this time. A Spill Prevention Control & Countermeasures (SPCC) Plan dated 2019 was available for review and is complete. Employee training records were available for review. Inspection records of APSTs were available for review. This inspection report was sent to info@billssweeping.net.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Evaluation:
Eval General Type: Compliance Evaluation Inspection
Eval Date: 01-28-2016
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: On site for a routine hazardous waste inspection. Charlie Piscopo, operations manager, was present for the inspection and provided consent to inspect. The facilityG s operations and the waste generated were discussed. The inspection included a walk of the facility's perimeter and its trash storage areas. I did not observe hazardous waste in the facility's trash or as run off on the ground. The storage of the shop's hazardous waste was inspected. The storage containers were closed and labeled. The records for the removal of the facility's hazardous waste was on site and available for inspection. The records for the last year were reviewed. We reviewed on site hazardous waste accumulation / storage times. The facility had written spill response directions and emergency contact numbers for the employees. report PDF to charlie piscopo

Eval Notes: From: Krall, Joyce Sent: Wednesday, March 02, 2016 9:12 AM To: 'Charlie Piscopo' Subject: RE: HAZARDOUS WASTE INSPECTION Hi Charlie, Thank you for your reminder email. I apologize for overlooking your first email! In order to make a hazardous waste determination, have a representative sample of the waste bag house dust analyzed by a state certified lab for California regulated heavy metals (Title 22, CCR). Perform a Total Threshold Limit Concentration (TTLC) analysis and if necessary, a Soluble Threshold Limit Concentration (STLC) analysis. Submit a copy of the lab analysis report to this Agency for evaluation and comment. If waste is not analyzed or if the lab analysis results are above Title 22, CCR hazardous waste criteria, then the waste must continue to be handled as hazardous waste. Please contact me if you should have any questions. Regards, Joyce Krall, REHS Hazardous Waste Specialist III Environmental Health, Health Care Agency [Truncated]

Eval Notes: On site to conduct a routine Hazardous Waste inspection. Met with Charlie Piscopo, Operations Manager. The facility is a Very Small Quantity Generator of waste oil and oily absorbent generated from structural steel fabrication, including cutting and welding. Walked throughout the facility and observed the facilityG s Hazardous Waste storage area. Hazardous waste containers were observed properly labeled and stored closed. The perimeter of the facility was walked and the municipal trash dumpster was observed. There are no signs of illegal disposal. Hazardous waste manifests were available for review. The facilityG s EPA ID number is active. Emergency plan is maintained on site. No hazardous waste violations were observed this date. This inspection report was sent to charlie@cundiff-steel.com.

Evaluation:

Eval General Type:	Compliance Evaluation Inspection
Eval Date:	04-03-2003
Violations Found:	Yes
Eval Type:	Industrial Storm Water Compliance Evaluation
Eval Notes:	Regional Board staff conducted a routine compliance inspection of the above facility on April 3, 2003. The SWPPP was lacking the following items: a certification page, training records, and monitoring program. Review of previous Annual Reports showed extremely high levels of Al, Fe, Zn, and N+N. The elevated levels of N+N are most likely due to the neighboring mulch manufacturer. Staff could not locate any pollution sources of nitrates originating from the permitted facility. The industrial processes are all under cover with a berm surrounding the area. There are three (3) discharge locations that discharge directly to the adjacent flood channel.

Eval Division: Water Boards
Eval Program: INDSTW
Eval Source: SMARTS

Eval General Type: Compliance Evaluation Inspection
Eval Date: 07-03-2018
Violations Found: No
Eval Type: Industrial Storm Water Compliance Evaluation
Eval Notes: Regional Board staff conducted a compliance inspection of the above facility on July 3, 2018. Staff met with Mr. William McGuire. The SWPPP and training records were not reviewed. The facility is currently in Level 1 for Iron and Aluminum and Level 2 for Zinc. The Level 2 ERA Action Plan BMP implementation schedule notes that a collection and percolation system will be installed near sampling locations #1 and #3. The facility is in the process of constructing the two collection systems. A memo uploaded in SMARTS, dated 02/07/2018, explains that Cundiff Steel is in the process of achieving zero discharge from their facility by constructing on-site infiltration systems. Another memo uploaded in SMARTS, dated 06/15/2018, notes the infiltration systems will be completed by the 3rd or 4th quarter of 2018, which is outlined in the Level 2 ERA Action Plan BMP implementation schedule.
Eval Division: Water Boards
Eval Program: INDSTW
Eval Source: SMARTS

Eval General Type: Compliance Evaluation Inspection
Eval Date: 08-21-2017
Violations Found: Yes
Eval Type: Industrial Storm Water Compliance Evaluation
Eval Notes: Regional Board staff conducted a compliance inspection of the above facility on August 21, 2017. The SWPPP was reviewed and needs to be updated to include the new media used for sand blasting. It was also determined the facility has been using litmus paper to sample pH since moving into Level 1 and Level 2 status. The facility needs to purchase a calibrated meter with 3 pH buffers for sampling. Subsequent employee training needs to be conducted to ensure proper meter calibration and use. A site walk was then conducted. A scrap metal stockpile was observed uncovered in an unpaved dirt lot. Mr. Piscopo explained the stockpile is covered with a tarp during rain events as the cost of the tarp is too expensive to maintain. A garden hose was observed on site and is used to hose down the trucks on the property. Mr. Piscopo explained the water does not flow off property (instead ponds) and he is aware this would constitute a Non-Storm Water Discharge and a violation of the permit if it flowed off the site.

Eval General Type:	Other/Unknown
Eval Date:	05-01-2017
Violations Found:	No
Eval Type:	Other, not routine, done by local agency
Eval Notes:	On site to conduct a routine hazardous waste inspection. Met with John Bejerano and Andrea Aldinger of Fletcher Coating Company. Mr. Bejerano provided consent to enter and conduct this inspection. Hazardous waste observed on-site included used hydraulic oil contained in a 55-gallon drum. Hazardous waste was properly labeled and stored closed. Hazardous waste manifests were available for review. Perimeter of the facility was inspected. Did not observe any indication of a hazardous waste release or illegal dumping along the perimeter of the facility.

FLETCHER COATING COMPANY (Continued) **S123517333**

Violations Found:	No
Eval Type:	Routine done by local agency
Eval Notes:	On site to conduct a routine Hazardous Waste inspection. Met with Kurtis Breeding, President. The facility is a Very Small Quantity Generator of waste oil from air compressor maintenance. Steel grit media blasting and powder coating operations were discussed and observed. Steel media blast is recycled as scrap metal when spent. Powder coat is applied in a closed loop system. Excess powder coat is captured in baghouse units and used back in process. Walked throughout the facility and observed the facilityG s Hazardous Waste storage area. One hazardous waste container was observed properly labeled and stored closed. The perimeter of the facility was walked and the municipal trash dumpster was observed. There are no signs of illegal disposal. Hazardous waste manifests were available for review. The facilityG s EPA ID number is active. Emergency plan is maintained on site. No hazardous waste violations were observed this date. This inspection report was [Truncated]

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Eval Notes:	HARVEST LANDSCAPE ENTERPRISES INC 2351 BATAVIA ST ORANGE 92665 On site to conduct a new business hazardous waste generator inspection. The business owner was identified as Harvest Landscape Enterprises Inc. Ignacio Santiago, mechanic, was present for the inspection and provided consent to inspect. The facilityG hazardous waste generator EPA ID # was CAL000313540. The facilityG s operations and the waste generated were discussed. The inspection included a walk of the facility's outside work and parking areas. I did not observe hazardous waste in the facility's trash or as run off on the ground. The storage of the facility's hazardous waste was inspected. The containers were marked with the required identifying information. We discussed maintaining the facilityG s records for the removal of its hazardous waste for 3 years from the date of removal and have available for inspection.. Written spill response directions and emergency contact numbers must be provided [Truncated]
Eval Division:	Orange County Environmental Health
Eval Program:	HW
Eval Source:	CERS

Eval General Type:	Compliance Evaluation Inspection
Eval Date:	08-22-2018
Violations Found:	Yes
Eval Type:	Routine done by local agency
Eval Notes:	Steven S attempted to locate the documents requested for inspection. Documents could not be located. Stephen S (owner) was contacted, and I agreed to return and complete the inspection when he was present.

HARVEST LANDSCAPE ENTERPRISE INC. (Continued) **S123518759**

	Returned to site on xxxx to meet with Stephen S, owner, to access records and complete inspection.

Eval Division:	Orange County Environmental Health
Eval Program:	HW
Eval Source:	CERS
Eval General Type:	Other/Unknown
Eval Date:	12-12-2018
Violations Found:	No
Eval Type:	Other, not routine, done by local agency
Eval Notes:	On site to conduct a Hazardous Waste reinspection. The facility was cited violation I053 during the last routine inspection on 8/22/18 for storing waste on site past its allowable accumulation time of 180 days. No waste was observed on site past accumulation time limits. A manifest dated 9/14/18 was available for review showing hazardous waste being hauled offsite. Violation I053 is corrected, no outstanding violations remain. Please ensure hazardous waste is disposed of within 180 days of its starting accumulation date. This report was sent to Maria Lopez at maria@hlei.us.

Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: On site for a routine hazardous waste inspection. Vic Eggers, vice president, was present for the inspection and provided consent to inspect. The facilityG s operations and the waste generated were discussed. The inspection included a walk of the facility’s outside

V&E TREE SERVICE (Continued) **U001577508**

perimeter and its trash storage areas. I did not observe hazardous waste in the facility's trash or as run off on the ground. The storage of the shop's hazardous waste was inspected. The storage containers were closed and labeled. We discussed the identifying information to be marked on containers storing hazardous waste. The receipts for the removal of the facility's hazardous waste were on site and available for inspection. The records for the last year were reviewed. A hazardous waste emergency response card was posted in the office area. The facility also had a SPCC plan, that contained emergency contact information and spill response directions. report PDF to vic@vetreeservice.com

Eval Date: 07-16-2015
Violations Found: Yes
Eval Type: Routine done by local agency
Eval Notes: On site for an above ground petroleum storage tank (APST) inspection. Vic Eggers, vice president, was present for the inspection. This facility is regulated under the Above Ground Storage Act (APSA). There is equal to or greater than 1,320 but less than 9,999 gallons of regulated petroleum products in drums or tanks sized 55 gallons or larger on site. The facility had a Spill Control and Countermeasure (SPCC) plan. Its most recent review date was 12-3-08. The plan was on site and available for review. SPILL CONTROL: Inspection found bulk petroleum storage secondary containment and available spill response sorbent materials were provided. We discussed the completion of the SPCC plan to include this information. INSPECTIONS: Owner reported that monthly inspections were being conducted as described in the plan. However, inspection records were not maintained. You must keep a record of the inspections and tests performed, signed by the appropriate supervisor or [Truncated]

Name: K & H MARINE
Address: 2387 N BATAVIA ST
City,State,Zip: ORANGE, CA 92865
Site ID: 181882
CERS ID: 10544863
CERS Description: Hazardous Waste Generator

Evaluation:
Eval General Type: Compliance Evaluation Inspection
Eval Date: 09-10-2020
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: On site to conduct a routine Hazardous Waste inspection. Met with Bob Grant, Owner. The facility is a Small Quantity Generator of waste oil and oil filters from boat repair. Walked throughout the facility and observed the facilityG s Hazardous Waste storage area. Hazardous Waste containers were observed properly labeled and stored closed. The perimeter of the facility was walked and the municipal trash dumpster was observed. There are no signs of illegal disposal. Hazardous waste manifests were available for review. The facilityG s EPA ID number is active. Emergency plan is maintained on site. No hazardous waste violations were observed this date. This inspection report was sent to info@knhmarine.com.

Eval General Type: Compliance Evaluation Inspection
Eval Date: 10-30-2018
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: INSPECTOR COMMENTS K & H MARINE 2387 NORTH BATAVIA ST ORANGE, CA 92865 CO0069028 EPA ID: CAL00009641 = ACTIVE On site to conduct a Hazardous Waste Generator inspection of the facility. Met this date with Bob Grant, Owner, who granted consent to enter and inspect and take photos if necessary. Facility is a boat maintenance site which conducts occasional boat oil changes as well. Hazardous waste generated on site is Waste Oil and Waste Oil Filters. Guidance documents provided this date. EPA ID is active. Manifests from Action Oil were available for review. Emergency information is posted in the office. Walked the entire lot and did not observed any signs of hazardous waste dumping. Looked in the facility dumpster also. No signs of leakage or any other signs of chemicals from any of the boats on site or other equipment (Engine blocks/engines). Labels were placed on the waste oil and waste filters this date. Report emailed to Bob Grant at info@knhmarine.com. [Truncated]

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Quarterly Update:	Inactive facility undergoing Corrective Action: Orange Precision Circuits (OPC) Facility consists of one building. The Facility operated from 1979 to October 1989. The Facility sits on a parcel which is 135 by 250 feet and covers 11,000 square feet or 0.6 acres at 812 Southern Avenue in the City of Orange. All operations were performed in the building. A parking area lies to the south and west of the building. Operations involved the manufacture of printed circuit boards. The Facility operated two hazardous waste units (HWMUs), a former 1,500-gallon underground storage tank (UST) (elementary neutralization) used to neutralize acid and caustic solutions for off-site disposal (HWMU1) and a 1000-gallon above-ground storage tanks (AST) used to store spent copper etchant (HWMU2). An Interim Status Document was issued to the facility on January 4, 1982. The Facility sought a variance in the 1983 for the elementary neutralization unit. The variance was initially granted on July 7, 1987 and later, upon review by DTSC, denied. In October 1989, OPC vacated the site and the land owner, Mr. Amos Deacon, Jr. took responsibility for closure of the regulated units and site cleanup. Mr. Deacon retained Waste Materials Management to prepare a Closure Plan. This Closure Plan, dated May 6, 1991, was submitted to DTSC and was modified by DTSC on February 24, 1992 as part of approval. The HWMU-2 had been removed prior to the facility being vacated by the operators in October 1989. HWMU-1 was removed by Waste Materials Management in 1992. Both of the tanks contained metal waste from plating operations. As part of the closure activities sampling was performed at the two hazardous waste management units. The closure activities were described in a certification report entitled Report of Subsurface Contamination Assessment dated April 29, 1992 prepared by Applied Geotechnical Engineering, Inc. DTSC acknowledged the certification on June 11, 1993.

Evaluation:
Eval General Type: Compliance Evaluation Inspection
Eval Date: 01-10-2014
Violations Found: Yes
Eval Type: Routine done by local agency
Eval Notes: On site for a routine hazardous waste inspection. Debbie Hamby, corporate secretary, was present for the inspection and provided

LAS FLORES LANDSCAPE INC (Continued) **S117642110**

consent to inspect. The facilityG s operations and the waste generated were discussed. The inspection included a walk of the facility's outside perimeter and its trash storage areas. I did not observe hazardous waste in the facility's trash or as run off on the ground. The storage of the shop's hazardous waste was inspected. The receipts for the removal of the facility's hazardous waste was on site and available for inspection. The records for the last year were reviewed. Spill response directions and emergency contact numbers must be provided for the employees. A hazardous waste emergency response card was provided for use if needed. report PDF to lasfloreslancscape@sbcglobal.net

Eval General Type: Compliance Evaluation Inspection
Eval Date: 05-24-2018
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: field verification.
Eval Division: Orange City Fire Department
Eval Program: HMRRP
Eval Source: CERS

Eval General Type: Compliance Evaluation Inspection
Eval Date: 06-11-2020
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: On site to conduct a routine Hazardous Waste inspection. Met with Joe Hamby, President. The facility is a Very Small Quantity Generator of automotive repair wastes from maintenance on vehicles and equipment. Walked throughout the facility and observed the facilityG s Hazardous Waste storage area. Hazardous Waste containers were observed properly labeled and stored closed. The perimeter of the facility was walked and the municipal trash dumpster was observed. There are no signs of illegal disposal. Hazardous waste manifests were available for review. The facilityG s EPA ID number is NOT active. Please completed DTSC EPA ID Application, Form 1358, attached with this report. Complete the application and send it to DTSC or call DTSC with the information provided to reactivate your EPA ID number. Emergency plan is maintained on site. No hazardous waste violations were observed this date. This inspection report was sent to [Truncated]

Eval Source:	CERS
Eval General Type:	Compliance Evaluation Inspection
Eval Date:	11-29-2016
Violations Found:	Yes
Eval Type:	Routine done by local agency
Eval Notes:	On site to conduct a routine hazardous waste inspection. Met with shop manager Juan Barra of Las Flores Landscape. Consent was provided to enter and conduct inspection activities. Hazardous waste observed onsite included used motor oil, used antifreeze, and used filters. All containers were labeled and stored properly on site. Waste manifests for all waste streams were available for review. Your EPA ID # for your facility is INACTIVE (See violation I352 above). Please activate your EPA ID # immediately. Go to https://www.acgov.org/forms/aceh/EPA_ID_Application.pdf Perimeter of the facility was inspected. Did not observe any indication of a hazardous waste release or illegal dumping in the trash dumpster.
